

Anderson mini connectors

In the packet you will be provided with the metal pin and plastic housing.

First step is to trim and smooth out the metal connectors, this will allow them to fit into the housing easier.

The metal connectors can then have the lead connected and be pushed through the plastic housing, in which they should “click” into place, with the metal lip facing downwards to latch over the thin metal in the housing.

The picture below shows the orientation of the metal clips in the housing.

You should be able to tug on the lead and find that the pins will not come out.
