Note: The images/screenshots used in this manual are for reference only – actual screens may vary according to firmware version. The contents of this

manual are based on the most recent firmware version at the time of writing.

1. Product Introduction

1.1. Package Contents

Before you start using this product, please check if there is anything missing in the package and contact your dealer to claim the missing item(s):

- ADSL2+ router
- RJ-45 Ethernet cable
- RJ-11 telephone line
- ADSL Splitter
- Quick installation guide
- CD containing setup wizard, user manual
- 5dBi antenna
- 12V power adapter

1.2. System Requirements

Recommended system requirements are as follows.

- A 10/100 base-T Ethernet card installed in your PC.
- A hub or Switch (connected to several PCs through one of the Ethernet interfaces on the device).
- Operating system: Windows 98 SE, Windows 2000, Windows ME, Windows XP, Windows 7, Windows 8/8.1.
- Internet Explorer V5.0 or higher, Netscape V4.0 or higher or Firefox 1.5 or higher.

1.3. Safety Precautions

Follow the following instructions to prevent the device from risks and damage caused by fire or electric power:

- Use volume labels to mark the type of power.
- Use the power adapter included within the package contents.
- Pay attention to the power load of the outlet or prolonged lines. An overburdened power outlet or damaged lines and plugs may cause an electric shock or fire. Check the power cords regularly. If you find any damage, replace it at once.
- Proper space left for heat dissipation is necessary to avoid damage caused by overheating to the device. The long and thin holes on the device are designed for heat dissipation to ensure that the device works normally. Do not cover these heat dissipation holes.
- Do not put this device close to heat sources or high temperatures. Keep the device out of direct sunshine.

- Do not put this device close to a place where it is damp or wet. Do not spill any fluid on this device.
- Do not connect this device to any PCs or electronic products, other than those which you are instructed or recommended to do so in the product’s documentation, by our customer engineers or by your broadband provider – connecting to incorrect devices may cause a fire risk.
- Place this device on a stable surface.

1.4. LED Status & Button Definitions

Front Panel

LED	Color	Status	Description
Power 	Green	On	ADSL2+ router is on.
		Off	ADSL2+ router is off.
	Red	On	ADSL broadband initial self-test failed or upgrading firmware.
ADSL	Green	On	ADSL line is synchronized and ready to use.
		Slow Flashing	ADSL synchronization failed (please refer to <i>Note i.</i> below)
		Quick Flashing	ADSL negotiation is in progress.
Internet	Green	On	Internet connected in router mode
		Flashing	Internet activity (transferring/receiving data) in router mode.
		Off	Device in bridged mode.
	Red	On	Internet not connected in router mode (Please refer to <i>Note ii.</i> below).
LAN1–4	Green	On	LAN port connected.
		Flashing	LAN activity (transferring/receiving data).
		Off	LAN port not connected.

WLAN 	Green	On	Successful WLAN connection.
		Flashing	WLAN activity (transferring/receiving data).
		Off	WLAN connection failed.
WPS	Green	Off	WPS is disabled.
		Flashing	WPS is enabled and waiting for client to negotiate.

 **Note i.**

If the ADSL LED is off, please check your Internet connection. Refer to A. Hardware Installation for more information about how to connect the router correctly. If all connections are correct, please contact your ISP to check if there is a problem with your Internet service.

ii.

If the Internet LED is red, please check your ADSL LED first. If the ADSL LED is off, refer to Note 1. If the green ADSL LED is ON, please check your Internet configuration. You may need to check with your ISP that your Internet is configured correctly.

Rear Panel

Item	Description
Power On/Off Button 	Switches the router on or off.
Power	Power port for included 12V power adapter.
Wireless On/Off Button 	Switch the wireless signal on or off.

Item	Description
WPS Button	Activate WPS (Wi-Fi Protected Setup)
LAN 1–4	RJ-45 Ethernet ports 1–4.
Reset Button	Hold for less than 5 seconds to restart the device, and hold for more than 10 seconds to reset the device to factory default settings.
Line	RJ-11 port for standard telephone line.

USB interface is used to connect a USB device, such as a USB flash disk or printer. Users can access and share the USB storage disk or use the printer device connecting to the router.

1.5. Features

The device supports the following features:

<ul style="list-style-type: none"> • Various line modes • External PPPoE dial-up access • Internal PPPoE/PPPoA dial-up access • 1483Bridged/1483Routed with dynamic ip or static ip • Multiple PVCs (8 PVCs supported) • DHCP server/relay • Static route • Network Address Translation(NAT) • DMZ • Virtual Server • Universal plug and play (UPnP) 	<ul style="list-style-type: none"> • Dynamic Domain Name Server(DDNS) • One-level password and username • Network Time Protocol(NTP) • Firmware upgrading through Web, TFTP, or FTP • Resetting to factory defaults through Reset button or Web • Diagnostic test • Web interface • Telnet CLI • IP/MAC/URL Filter • Application layer service • QOS • Port binding
---	---

2. Hardware Installation

1. Connect the ADSL line.

Connect the line port of the router of the device to the modem interface of a splitter using a telephone cable. Connect a telephone to the Phone interface of the splitter using a telephone cable. Connect the Line interface of the splitter to your existing, incoming line.

The splitter has three interfaces:

- Line: Connect to a wall phone jack (RJ-11 jack).
- Modem: Connect to the ADSL jack of the device.
- Phone: Connect to a telephone set.

2. Connect the router to your LAN network.

Connect the LAN interface of the router to your PC, hub or switch using an Ethernet cable.

3. Connect the power adapter to the router.

Plug one end of the power adapter into a wall outlet and connect the other end to the 12V interface of the device.

The following diagrams show how to correctly connect the router, PC, splitter and the telephone sets under two different configurations:

Configuration 1

0 shows the correct connection of the router, PC, splitter and the telephone sets, with no telephone set placed before the filter.

Figure 1 –Connection diagram
(Without connecting telephone sets before the filter)

Configuration 2

0 shows the correct connection when a telephone set is installed before the filter.

Figure 2 - Connection diagram
(Connecting a telephone set before the filter)

Note:

When **Configuration 2** is used, the filter must be installed close to the telephone cable. Do not use the splitter to replace the filter.

Installing a telephone directly before the splitter may lead to failure of connection between the device and the central office, or failure of Internet access, or slow connection speed. If you really need to add a telephone set before the splitter, you must add a micro filter before a telephone set. Do not connect several telephones before the splitter or connect several telephones with the micro filter.

4. Check the ADSL LED status.

Please check the ADSL LED on the front panel. This light indicates the status of your ADSL broadband through your telephone line. If the light is on, you can continue setup. However if the light is flashing, there is no broadband line detected. Please call your Internet Service Provider (ISP) and inform them about the flashing ADSL light to resolve the issue.

5. Firewall settings.

Please turn off all personal firewalls before you continue the setup – firewalls can block communication between your PC and router.

Note: You must use the power adapter included in the package with the router, do NOT attempt to use a third-party power adapter.

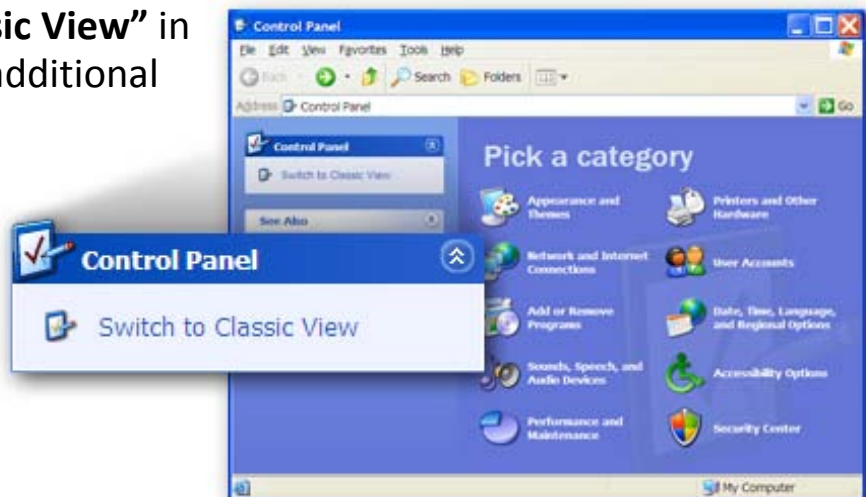

6. PC LAN IP configuration.

Configure your PC's LAN settings to automatically obtain an IP address from the router by following the steps below:

1. Click **“Start”** and then select **“Control Panel”**.

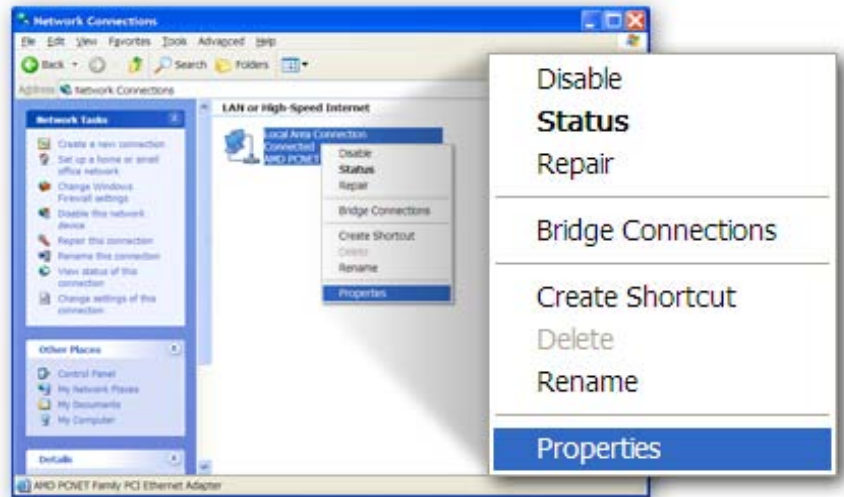

2. Click **“Switch to Classic View”** in the top left to show additional setting icons.

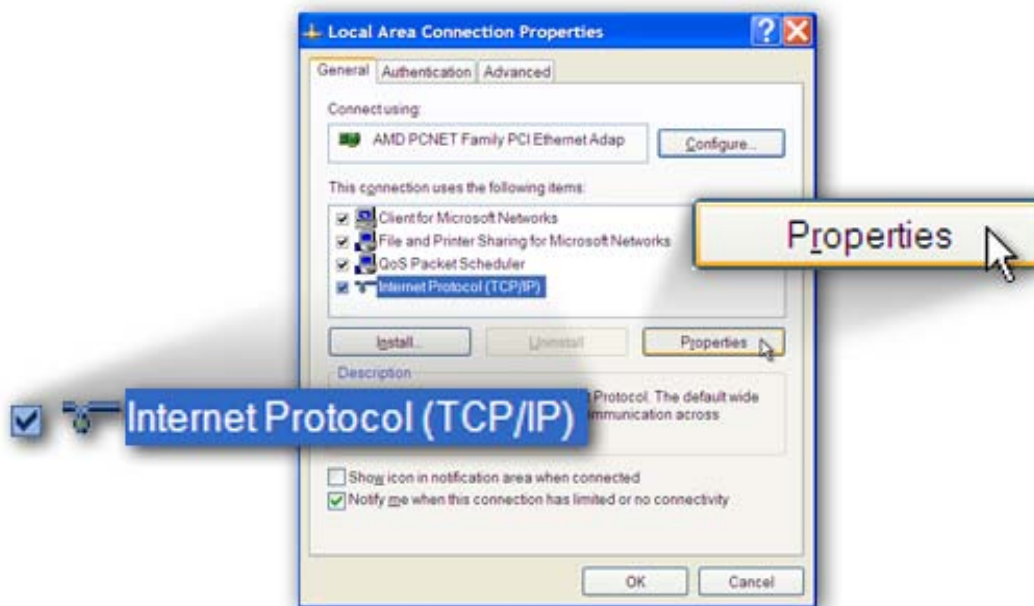

3. Locate the **“Network Connections”** icon and double-click to open network connection settings.

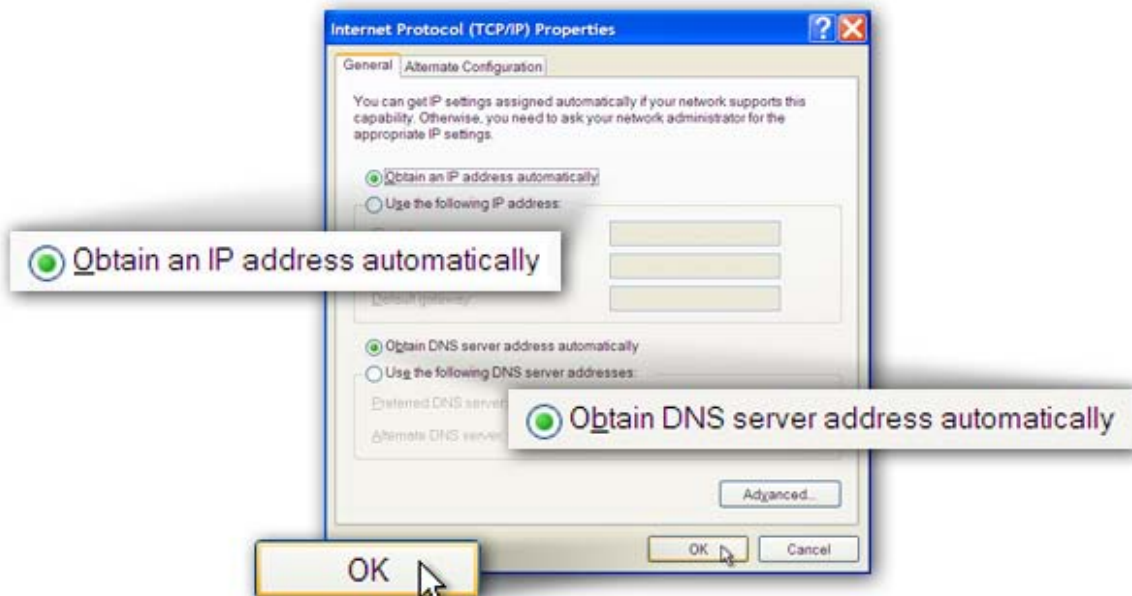

4. Select the **“Local Area Connection”** icon and right-click it to open the sub-menu, then select **“Properties”**.

5. Select **“Internet Protocol (TCP/IP)”** and then click **“Properties”**

6. Ensure that **“Obtain an IP address automatically”** and **“Obtain DNS server address automatically”** are selected and then press **“OK”**.

3. IP Address Setting

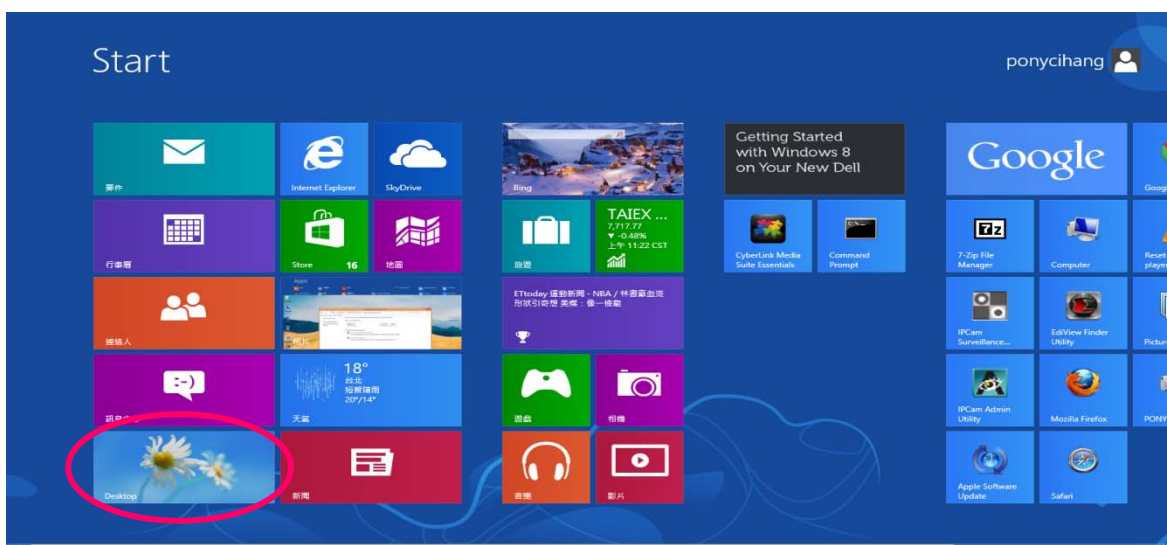

To use the router to access the Internet, the PCs in the network must have an Ethernet adapter installed and be connected to the router either directly or through a hub or switch. The TCP/IP protocol of each PC must be installed and the IP Address of each PC has to be set in the same subnet as the router.

The router's default IP Address is **192.168.2.1** and the subnet mask is **255.255.255.0**. PCs can be configured to obtain IP Address automatically through the DHCP Server of the router or a fixed IP Address in order to be in the same subnet as the router. By default, the DHCP Server of the router is enabled and will dispatch IP Address to PC from **192.168.2.100** to **192.168.2.199**. It is strongly recommended to set obtaining IP address automatically.

This section shows you how to configure your PC so that it can obtain an IP address automatically for either Windows 95/98/Me, 2000 or NT operating systems. For other operating systems (Macintosh, Sun, etc.), please follow the manual of the operating system. The following is a step-by-step illustration of how to configure your PC to obtain an IP address automatically for **Windows 8, Windows 7, Windows Vista and Windows XP**.

3.1. Windows 8

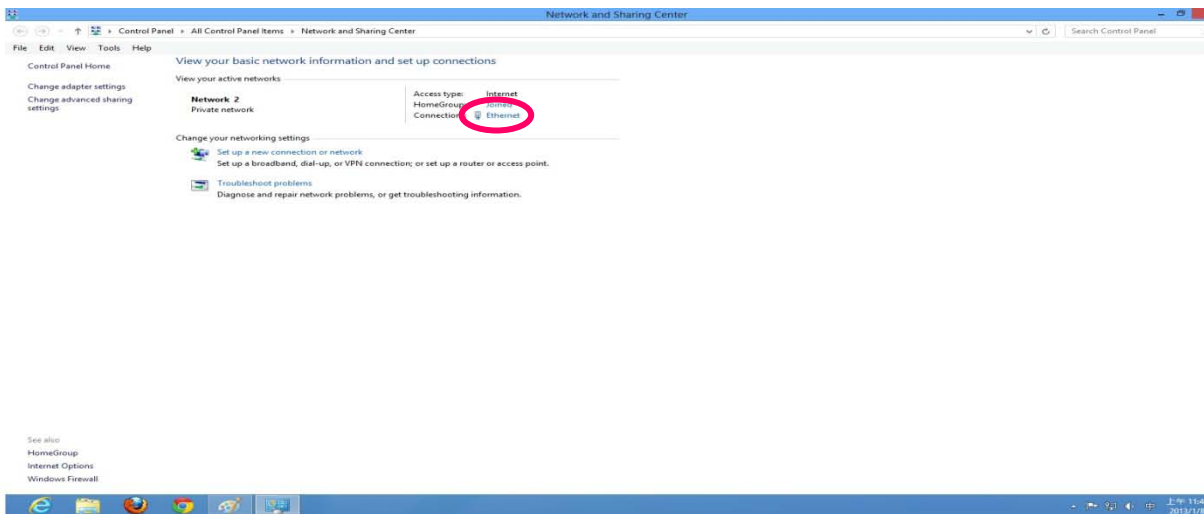

1. From the Windows 8 Start screen, you need to switch to desktop mode. Click the Desktop icon in the bottom left of the screen.

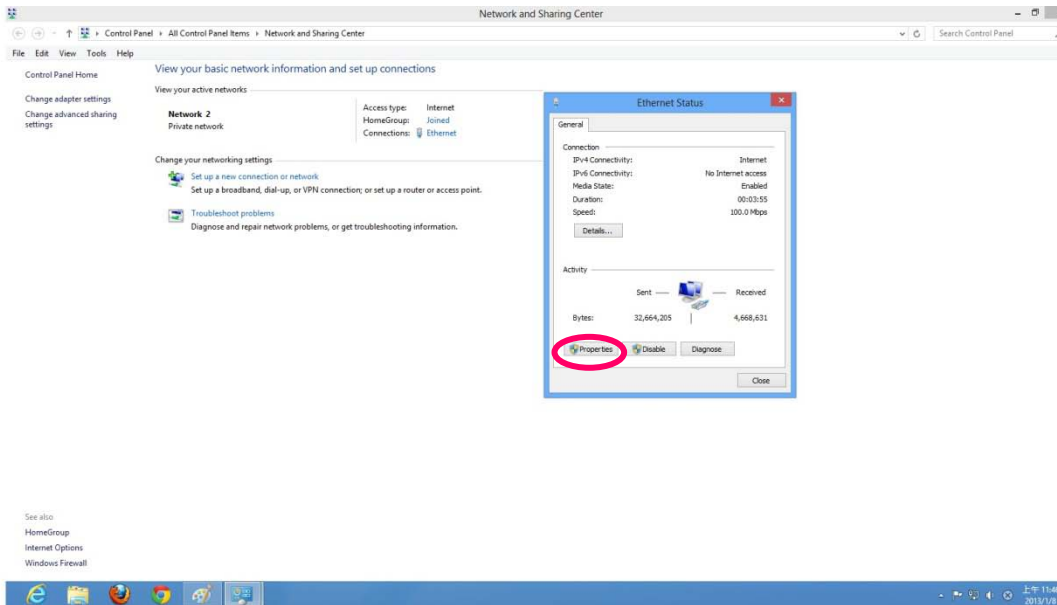

2. Click the Network icon  and then select Open Network and Sharing Center to open the Network and Sharing Center window.

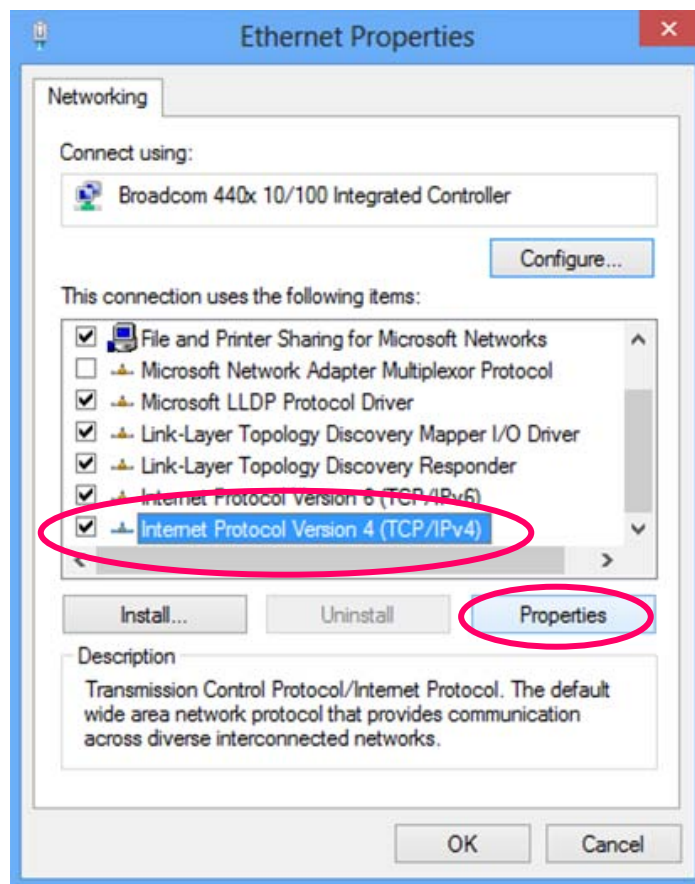

3. Click Ethernet to open the Ethernet Status window, and then select Properties. The Local Area Connection window will appear.

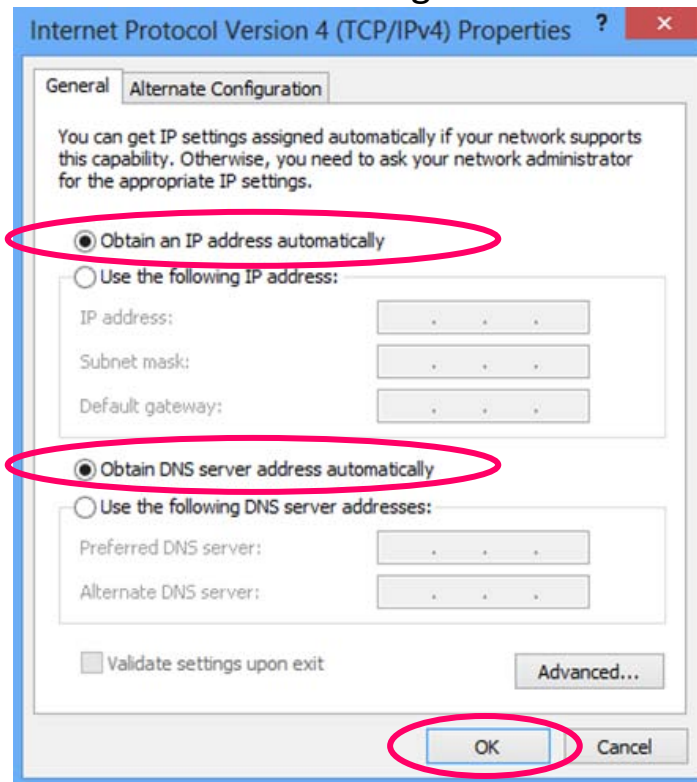

4. Check your list of Network Components. Select Internet Protocol Version 4 (TCP/IPv4) and click the Properties button.

5. In the Internet Protocol Version 4 (TCP/IPv4) Properties window, select Obtain an IP address automatically and Obtain DNS server address automatically as shown on the following screen.

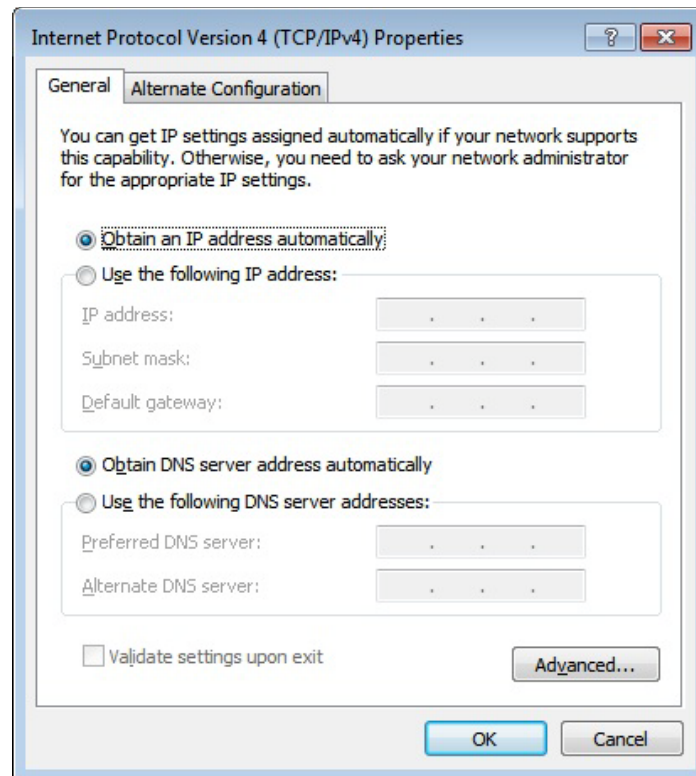

6. Click OK (shown above) to confirm the setting. Your PC will now obtain an IP address automatically from your router's DHCP server.

Note: Please make sure that the router's DHCP server is the only DHCP server available on your LAN.

3.2. Windows 7

1. Click the Start button and select Control Panel. Double click Network and Internet and click Network and Sharing Center, the Network and Sharing Center window will appear.
2. Click Change adapter settings and right click on the Local Area Connection icon and select Properties. The Local Area Connection window will appear.
3. Check your list of Network Components. You should see Internet Protocol Version 4 (TCP/IPv4) on your list. Select it and click the Properties button.

4. In the Internet Protocol Version 4 (TCP/IPv4) Properties window, select Obtain an IP address automatically and Obtain DNS server address automatically as shown on the following screen.

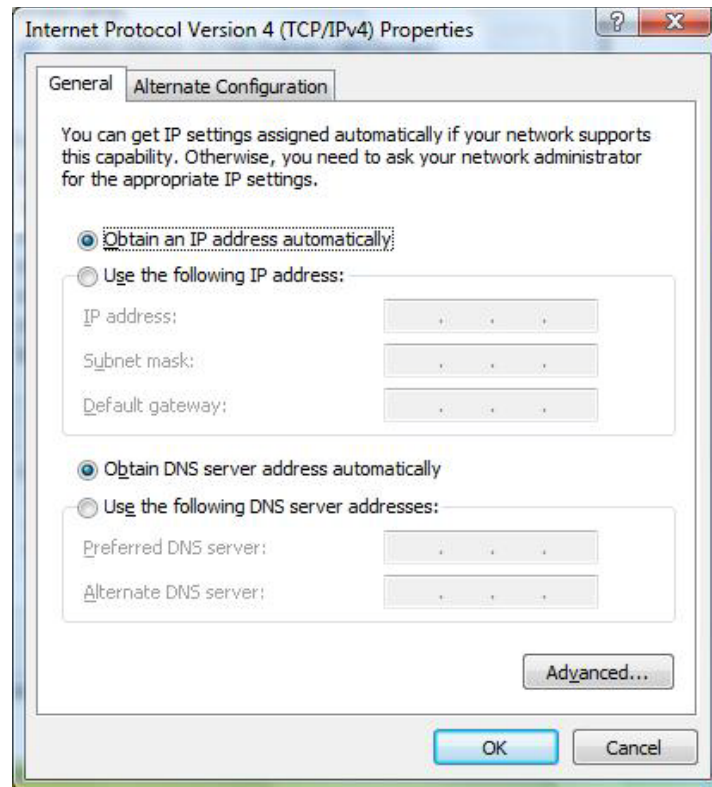

5. Click OK to confirm the setting. Your PC will now obtain an IP address automatically from your router's DHCP server.

Note: Please make sure that the router's DHCP server is the only DHCP server available on your LAN.

3.3. Windows Vista

1. Click the Start button and select Settings and then select Control Panel. Double click Network and Sharing Center, the Network and Sharing Center window will appear.
2. Click Manage network connections and right click on the Local Area Connection icon and select Properties. The Local Area Connection window will appear.
3. Check your list of Network Components. You should see Internet Protocol Version 4 (TCP/IPv4) on your list. Select it and click the Properties button.

4. In the Internet Protocol Version 4 (TCP/IPv4) Properties window, select Obtain an IP address automatically and Obtain DNS server address automatically as shown on the following screen.

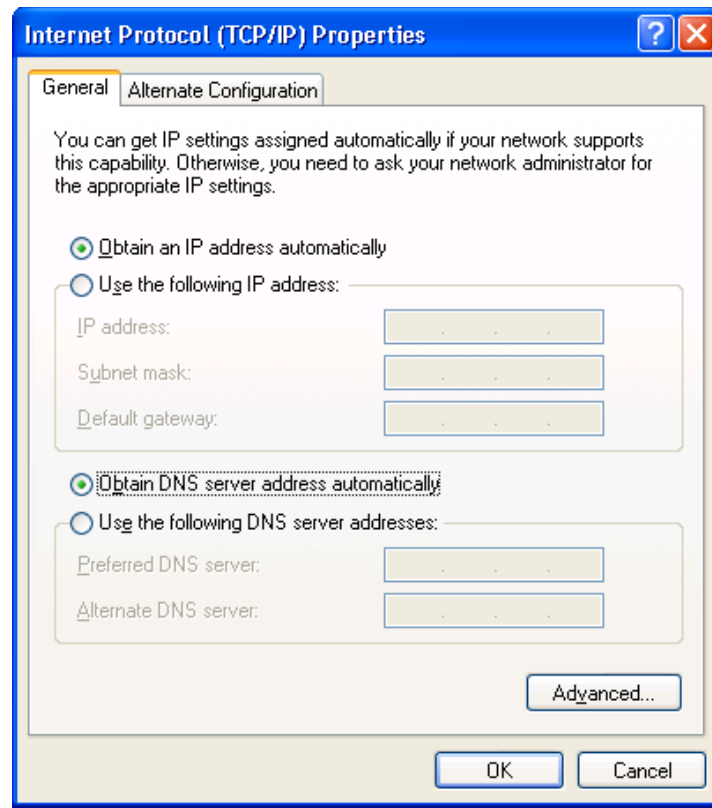

5. Click OK to confirm the setting. Your PC will now obtain an IP address automatically from your router's DHCP server.

Note: Please make sure that the router's DHCP server is the only DHCP server available on your LAN.

3.4. Windows XP

1. Click the Start button and select Control Panel and then double click Network Connections. The Network Connections window will appear.
2. Right click on the Local Area Connection icon and select Properties. The Local Area Connection window will appear.
3. Check your list of Network Components. You should see Internet Protocol [TCP/IP] on your list. Select it and click the Properties button.

4. In the Internet Protocol (TCP/IP) Properties window, select Obtain an IP address automatically and Obtain DNS server address automatically as shown on the following screen.

5. Click OK to confirm the setting. Your PC will now obtain an IP address automatically from your router's DHCP server.

Note: Please make sure that the router's DHCP server is the only DHCP server available on your LAN.

3.5. Mac OS X

1. Have your Mac computer operate as usual, and click on "System Preferences".

2. In System Preferences, click on "Network".

3. Click on "Wi-Fi" in the left panel and then click "Advanced" in the lower right corner.

4. Select "TCP/IP" from the top menu and "Using DHCP" in the drop down menu labeled "Configure IPv4" should be selected.

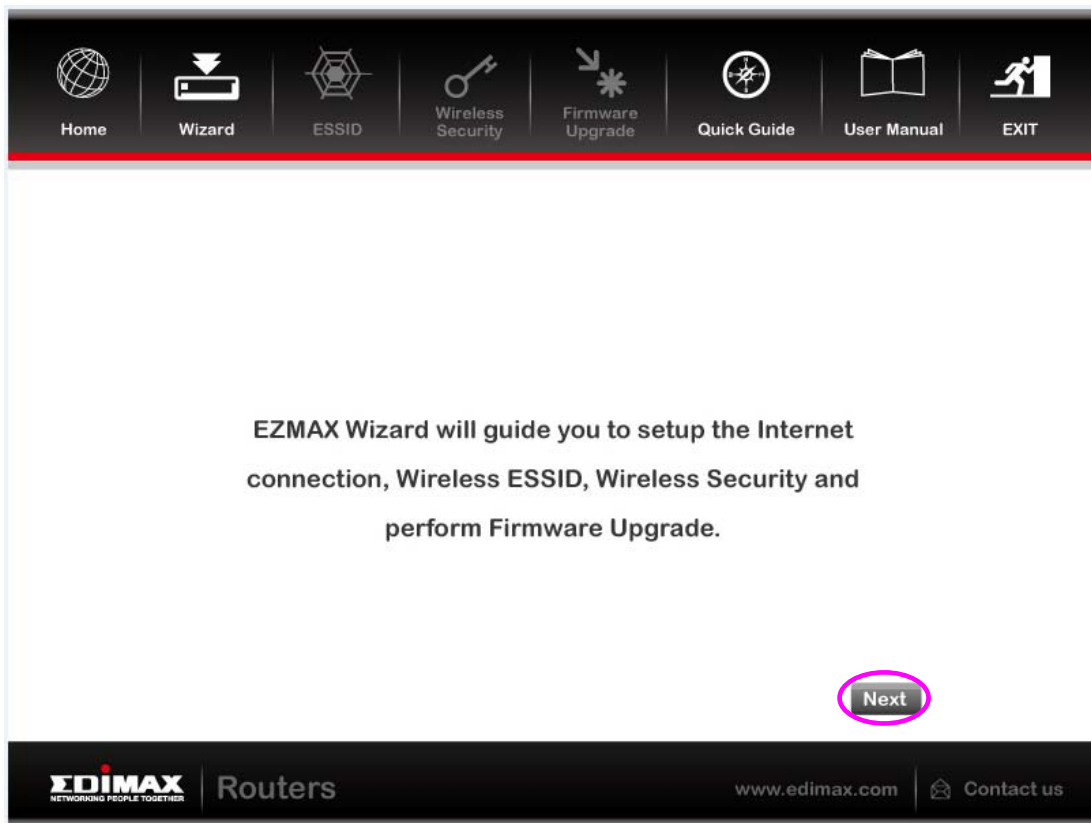

4. EZmax Setup Wizard

You can configure the router by running the setup wizard on the CD-ROM included in the package contents. The wizard enables you to configure your Internet connection, upgrade the firmware and change the router's password. Please follow the instructions below.

Alternatively, if you lose the CD-ROM or prefer a web based setup, you can login to the ADSL router using Internet Explorer, and configure the router from there using the web-based interface. Instructions for how to do so can be found in **5. Web Configuration**.

4.1. Setup Wizard

1. When you start the setup wizard, you will see the following screen. Please follow the on screen instructions.

2. Please select your product.

3. Please ensure all hardware is correctly installed. Check the box and click “Next”.

Connect the supplied RJ-11 telephone cable to the ADSL port and connect it to your telephone socket with an ADSL filter. Then, connect the supplied Ethernet cable from your computer to the LAN port 2. (For wireless router, please do not use wireless connection. It's recommended to use Ethernet cable connection for this setup)

Internet

RJ-11 Phone Cable

ADSL Modem Router

RJ-45 Ethernet Cable

PC

YES, I have connected the cables correctly.

Next

The diagram illustrates the physical connection of an ADSL modem router. A blue line labeled 'RJ-11 Phone Cable' connects the router's ADSL port to an 'Internet' icon. A yellow line labeled 'RJ-45 Ethernet Cable' connects the router's LAN port 2 to a 'PC' icon. The router is labeled 'ADSL Modem Router'. Below the diagram, a checkbox is checked and circled in pink, with the text 'YES, I have connected the cables correctly.' and a 'Next' button.

4. Select your country and ISP. If your ISP is not listed, select “Other” from the list and refer to **4.2. Internet Connection Type**.

Internet Connection

AR-7288WnA Configuring

Select your country and ISP. If the country or ISP is not listed, please select “Others” from the list.

Country: Australia

ISP: Telstra Bigpond

Next

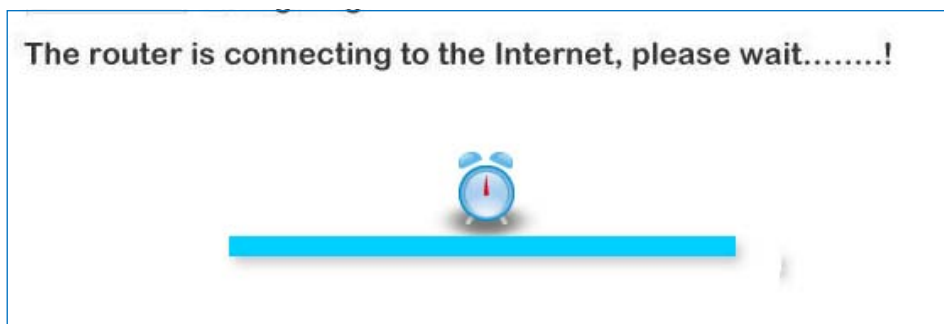

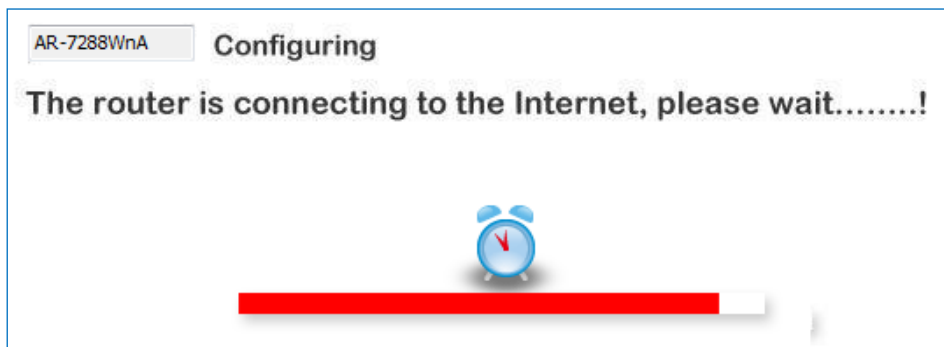

The screenshot shows the 'Internet Connection' configuration screen. It includes a title bar with 'AR-7288WnA Configuring' and instructions to select a country and ISP. Two dropdown menus are visible: 'Country: Australia' and 'ISP: Telstra Bigpond', both of which are circled in pink. A 'Next' button is located at the bottom right.

5. Enter your ISP's username and password and click "Apply". On the next screen, click "Apply" again.

The screenshot shows the 'Internet Connection' configuration page for an Edimax AR-7288WnA router. At the top, there is a navigation bar with icons for Home, Wizard, ESSID, Wireless Security, Firmware Upgrade, Quick Guide, User Manual, and EXIT. The main heading is 'Internet Connection' with a sub-heading 'Configuring' and the device ID 'AR-7288WnA'. The instructions state: 'Enter your ISP's username and password. (Your ISP should have provided this information to you. Please contact your ISP if you forget the username or password)'. There are two input fields: 'Username:' and 'Password:'. Below these fields are 'Back' and 'Apply' buttons. The 'Apply' button is circled in pink. At the bottom of the page, there is a footer with the Edimax logo, 'Routers', the website 'www.edimax.com', and a 'Contact us' link.

The screenshot shows the 'Settings Overview' page for the same Edimax AR-7288WnA router. The heading is 'Settings Overview' with a sub-heading 'Configuring' and the device ID 'AR-7288WnA'. The page displays the following configuration details in a list format: 'Country: Australia', 'ISP: Telstra Bigpond', 'VPI: 8', 'VCI: 35', and 'Connection Type: ADSLTYPE_PPPOE_LLC'. At the bottom right, there are 'Back' and 'Apply' buttons. The 'Apply' button is circled in pink.

6. Please wait while the router connects to the Internet. When the router is connected successfully, you will see the screen below.

4.2. Internet Connection Type

4.3. Firmware Upgrade

The wizard includes a tool to upgrade the router’s firmware. Firmware can be downloaded from the Edimax website; if you wish to upload new firmware, select “Firmware Upgrade” from the menu across the top of the screen.

Home Wizard ESSID Wireless Security **Firmware Upgrade** Quick Guide User Manual EXIT

Firmware Upgrade

AR-7288WnA Configuring

To upgrade the firmware, please download the latest firmware from Edimax website. Save and unzip the firmware file to a directory in your computer. Click on “Browse” to browse to the firmware file. Then Click on “Confirm” to start the firmware upgrade.

Warning: DO NOT interrupt during the upgrade.

Browse **Confirm**

After the firmware upgrade, please reset the router back to factory default so that the new firmware can take effect. Then run EZMAX Wizard to setup the router to the internet. All other functions are on top menu.

EDIMAX NETWORKING PEOPLE TOGETHER | Routers | www.edimax.com | Contact us

5. Web-Based Management

The router can also be configured using the web-based configuration interface. Follow the instructions below.

5.1. Accessing the Router

To access the web-based configuration interface:

1. Open the Internet Explorer (IE) browser and enter <http://192.168.2.1>.
2. In the **Login** page that is displayed, enter the username and password.
 - The username and password of the super user are **admin** and **1234**.

Note:

In the Web configuration page, the settings can be saved permanently.

After logging in to the DSL router as a super user, the page shown as the following figure appears. You can query, configure, and modify all the settings, and diagnose the system.

- Device Info
- Quick Start
- Advanced Setup
- Wireless
- Diagnostics
- Management

Device Info

Board ID:	96318REF
Model Name:	AR-7288Wna

5.2. Device Info

Choose **Device Info**, and the submenus of **Device Info** are shown as below: You can view the basic information of the router and running status of all interfaces.

5.3. Advanced Setup

Click **Advanced Setup** and the submenus of **Advanced Setup** appears. In this section, you can set the parameters of the router to connect to the internet

5.3.1. Layer2 Interface

- **ATM Interface**

For the first time to configure your router, you need to add at least an ATM Interface.

Step 1 Choose **Advance Setup > Layer2 Interface > ATM Interface**, and the following page appears. In this page, you can add or remove the DSL ATM Interfaces.

DSL ATM Interface Configuration

Choose Add, or Remove to configure DSL ATM interfaces.

Interface	Vpi	Vci	DSL Latency	Category	Peak Cell Rate(cells/s)	Sustainable Cell Rate(cells/s)	Max Burst Size(bytes)	Min Cell Rate(cells/s)	Link Type	Connection Mode	IP QoS	MPAAL Prec/Alg/Wght	Remove
-----------	-----	-----	-------------	----------	-------------------------	--------------------------------	-----------------------	------------------------	-----------	-----------------	--------	---------------------	--------

Step 2 In this page, click **Add** to add an ATM interface, and the following page appears.

ATM PVC Configuration

This screen allows you to configure a ATM PVC.

VPI: [0-255]
 VCI: [32-65535]

Select DSL Latency
 Path0 (Fast)
 Path1 (Interleaved)

Select DSL Link Type (EoA is for PPPoE, IPoE, and Bridge.)
 EoA
 PPPoA
 IPoA

Encapsulation Mode:

Service Category:

Select Scheduler for Queues of Equal Precedence as the Default Queue
 Weighted Round Robin
 Weighted Fair Queuing

Default Queue Weight: [1-63]
 Default Queue Precedence: [1-8] (lower value, higher priority)

VC WRR Weight: [1-63]
 VC Precedence: [1-8] (lower value, higher priority)

Note: VC scheduling will be SP among unequal precedence VC's and WRR among equal precedence VC's.
 For single queue VC, the default queue precedence and weight will be used for arbitration.
 For multi-queue VC, its VC precedence and weight will be used for arbitration.

Step 3 In this page, you can set the parameters of an ATM interface. Select **DSL Link Type** to be **EoA** if you want to add a PPPoE WAN Service. Keep other parameters as default. Then click **Apply/Save**. An ATM Interface is added as the coming page displays.

DSL ATM Interface Configuration

Choose Add, or Remove to configure DSL ATM interfaces.

Interface	Vpi	Vci	DSL Latency	Category	Peak Cell Rate(cells/s)	Sustainable Cell Rate(cells/s)	Max Burst Size(bytes)	Min Cell Rate(cells/s)	Link Type	Connection Mode	IP QoS	MPAAL Prec/Alg/Wght	Remove
atm0	0	35	Path0	UBR					EoA	VlanMuxMode	Support	8/WRR/1	<input type="checkbox"/>

Note:

QoS cannot be set for CBR and Realtime VBR.

● ETH Interface

Choose **Advanced Setup > Layer2 Interface > ETH Interface**, and the following page appears.

ETH WAN Interface Configuration

Choose Add, or Remove to configure ETH WAN interfaces.
Allow one ETH as layer 2 wan interface.

Name	Connection Mode	Remove

In this page, you can add or remove the DSL ETH Interfaces.

Click the **Add** button to display the following page. In this page, select a Ethernet port to configure. After setting, click the **Apply/Save** button to enable the settings.

ETH WAN Configuration

This screen allows you to configure an ETH port .

Select an ETH port:

5.3.2. WAN Service

Choose **Advance Setup > WAN Service** and the following page appears. In this page, you may add, remove or edit a WAN service.

Wide Area Network (WAN) Service Setup

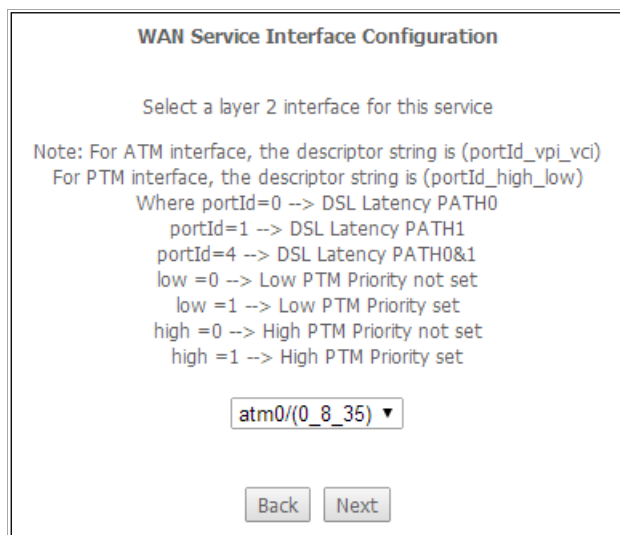

Choose Add, Remove or Edit to configure a WAN service over a selected interface.

Interface	Description	Type	Vlan802.1p	VlanMuxId	Igmp	NAT	Firewall	IPv4	IPv6	Mld	Remove	Edit	Action

● Adding a PPPoE WAN Service

This section describes the steps for adding the PPPoE WAN service.

Step 1 In the **Wide Area Network (WAN) Service Setup** page, click the **Add** button to display the following page. (First a proper ATM configuration should be added for this WAN service.)

WAN Service Interface Configuration

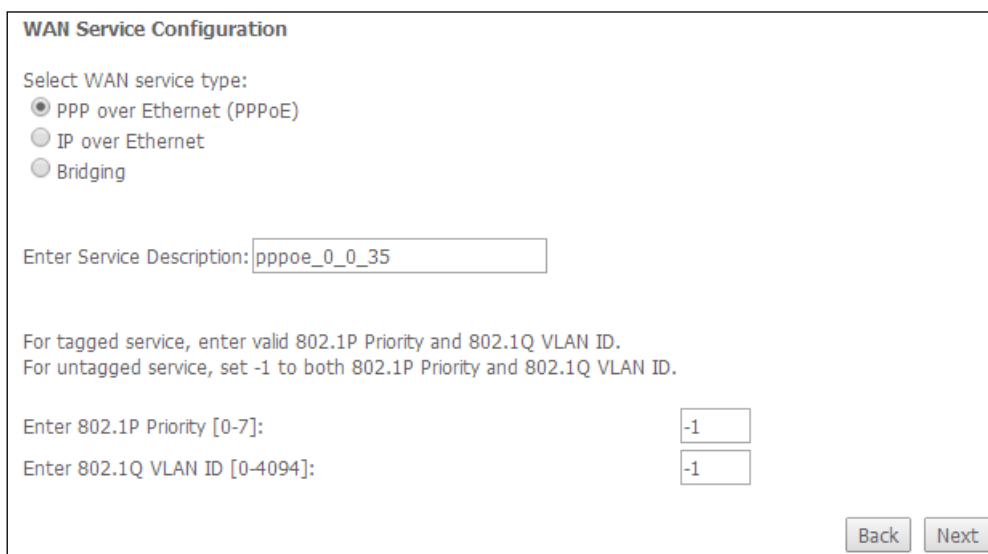

Select a layer 2 interface for this service

Note: For ATM interface, the descriptor string is (portId_vpi_vci)
For PTM interface, the descriptor string is (portId_high_low)
Where portId=0 --> DSL Latency PATH0
portId=1 --> DSL Latency PATH1
portId=4 --> DSL Latency PATH0&1
low =0 --> Low PTM Priority not set
low =1 --> Low PTM Priority set
high =0 --> High PTM Priority not set
high =1 --> High PTM Priority set

atm0/(0_8_35) ▾

Back Next

Step 2 In this page, you can select an ATM Interface for the WAN service. After selecting the ATM interface, click **Next** to display the following page.

WAN Service Configuration

Select WAN service type:

- PPP over Ethernet (PPPoE)
- IP over Ethernet
- Bridging

Enter Service Description: pppoe_0_0_35

For tagged service, enter valid 802.1P Priority and 802.1Q VLAN ID.
For untagged service, set -1 to both 802.1P Priority and 802.1Q VLAN ID.

Enter 802.1P Priority [0-7]: -1

Enter 802.1Q VLAN ID [0-4094]: -1

Back Next

Step 3 In this page, select the WAN service type to be **PPP over Ethernet (PPPoE)**. Click **Next** to display the following page.

PPP Username and Password

PPP usually requires that you have a user name and password to establish your connection. In the boxes below, enter the user name and password that your ISP has provided to you.

PPP Username:

PPP Password:

PPPoE Service Name:

Authentication Method:

MTU[576-1492]:

Config KeepAlive

Enable Fullcone NAT

Dial on demand (with idle timeout timer)

Enable IPv4 for this service

PPP IP extension

Use Static IPv4 Address

Enable IPv6 for this service

Enable PPP Debug Mode

Bridge PPPoE Frames Between WAN and Local Ports

Multicast Proxy

Enable IGMP Multicast Proxy

Step 4 In this page, you can modify the PPP username, PPP password, PPPoE service name and authentication method.

- **PPP Username:** The correct user name provided by your ISP.
- **PPP Password:** The correct password provided by your ISP.
- **PPPoE Service Name:** If your ISP provides it to you, please enter it. If not, do not enter any information.
- **Authentication Method:** The method to testify the entered PPP username and password. Usually, you can select AUTO.
- **Enable Fullcone NAT:** NAT is one where all requests from the same internal IP address and port are mapped to the same external IP address and port. Furthermore, any external host can send a packet to the internal host, by sending a packet to the mapped external address.
- **Dial on demand (with idle timeout timer):** If this function is enabled, you need to enter the idle timeout time. Within the preset minutes, if the router does not detect the flow of the user continuously, the router automatically stops the PPPoE connection. Once it detects the flow (like access to a webpage), the router restarts the PPPoE dialup. If this function is disabled, the router performs PPPoE dial-up all the time.
- **PPP IP extension:** If you want to configure DMZ Host, you should enable it first.
- **Use Static IPv4 Address:** If this function is disabled, the router obtains an IP address assigned by uplink equipment such as BAS, through PPPoE dial-

up. If this function is enabled, the router uses this IP address as the WAN IP address.

- **Enable PPP Debug Mode:** Enable or disable this function.
- **Bridge PPPoE Frames Between WAN and Local Ports:** Enable or disable this function.
- **Enable IGMP Multicast Proxy:** If you want PPPoE mode to support IPTV, enable it.

Step 5 After setting the parameters, click **Next** to display the following page.

Routing -- Default Gateway

Default gateway interface list can have multiple WAN interfaces served as system default gateways but only one will be used according to the priority with the first being the highest and the last one the lowest priority if the WAN interface is connected. Priority order can be changed by removing all and adding them back in again.

Selected Default Gateway Interfaces

Step 7 In this page, you may select a **DNS server interface** from the available WAN interfaces. Click **Next**, and the following page appears.

WAN Setup - Summary

Make sure that the settings below match the settings provided by your ISP.

Connection Type:	PPPoE
NAT:	Enabled
Full Cone NAT:	Disabled
Firewall:	Enabled
IGMP Multicast:	Disabled
Quality Of Service:	Disabled

Click "Apply/Save" to have this interface to be effective. Click "Back" to make any modifications.

Step 8 In this page, it displays the information about the PPPoE settings. Click **Apply/Save** to save and apply the settings.

Adding a MER (IPoE) WAN service

This section describes the steps for adding the MER WAN service.

Step 1 Back to the **Wide Area Network (WAN) Service Setup** page, and click the **Add** button to display the following page. (At first, you must add an ATM interface for this WAN service.)

WAN Service Interface Configuration

Select a layer 2 interface for this service

Note: For ATM interface, the descriptor string is (portId_vpi_vci)
 For PTM interface, the descriptor string is (portId_high_low)
 Where portId=0 --> DSL Latency PATH0
 portId=1 --> DSL Latency PATH1
 portId=4 --> DSL Latency PATH0&1
 low =0 --> Low PTM Priority not set
 low =1 --> Low PTM Priority set
 high =0 --> High PTM Priority not set
 high =1 --> High PTM Priority set

atm1/(0_0_36) ▼

Step 2 Select an ATM Interface, and then click **Next** to display the following page.

WAN Service Configuration

Select WAN service type:

PPP over Ethernet (PPPoE)

IP over Ethernet

Bridging

Enter Service Description:

For tagged service, enter valid 802.1P Priority and 802.1Q VLAN ID.
For untagged service, set -1 to both 802.1P Priority and 802.1Q VLAN ID.

Enter 802.1P Priority [0-7]:

Enter 802.1Q VLAN ID [0-4094]:

Step 3 In this page, select the WAN service type to be **IP over Ethernet**, enter the service description for this service. After setting, click **Next** to display the following page.

WAN IP Settings

Enter information provided to you by your ISP to configure the WAN IP settings.
Notice: If "Obtain an IP address automatically" is chosen, DHCP will be enabled for PVC in IPoE mode.
If "Use the following Static IPv4/IPv6 address" is chosen, enter the WAN IPv4/IPv6 address, subnet mask/prefix Length and interface gateway.

Enable IPv4 for this service

Obtain an IP address automatically

Use the following Static IP address

Option 55 Request List : (e.g:1,3,6,12)

Option 58 Renewal Time: (hour)

Option 59 Rebinding Time: (hour)

Option 60 Vendor ID:

Option 61 IAID: (8 hexadecimal digits)

Option 61 DUID: (hexadecimal digit)

Option 125: Disable Enable

Enable IPv6 for this service

Step 4 In this page, you may modify the WAN IP settings. You may select obtain an IP address automatically or manually enter the IP address provided by your ISP. Click **Next** and the following page appears.

Note:

*If selecting **Obtain an IP address automatically**, DHCP will be enabled for PVC in MER mode.*

*If selecting **Use the following Static IP address**, please enter the WAN IP address, subnet mask and gateway IP address.*

Network Address Translation Settings

Network Address Translation (NAT) allows you to share one Wide Area Network (WAN) IP address for multiple computers on your Local Area Network (LAN).

- Enable NAT
- Enable Firewall

Multicast Proxy

- Enable IGMP Multicast

Back Next

Step 5 In this page, you can set the network address translation settings, for example, enabling NAT, enabling firewall, and enabling IGMP multicast. After setting, click **Next** and the following page appears.

Routing -- Default Gateway

Default gateway interface list can have multiple WAN interfaces served as system default gateways but only one will be used according to the priority with the first being the highest and the last one the lowest priority if the WAN interface is connected. End IP Address:
Primary DNS server:
Secondary DNS server:
Leased Time (hour):

Static IP Lease List: (A maximum 32 entries can be configured)

[Edit DHCP Option 60](#) [Edit DHCP Option](#) [DHCP Advance setup](#)

MAC Address	IP Address	Remove
Add Entries	Remove Entries	

Configure the second IP Address and Subnet Mask for LAN interface

[Apply/Save](#)

In this page, you can configure an IP address for the DSL router, enable IGMP snooping, enable or disable the DHCP server, edit the DHCP option, configure the DHCP advanced setup and set the binding between a MAC address and an IP address.

Configuring the Private IP Address for the DSL Router

IP Address:	<input type="text" value="192.168.2.1"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>

In this page, you can modify the IP address of the device. The preset IP address is 192.168.1.1.

Enable IGMP Snooping

IGMP snooping enables the router to forward multicast traffic intelligently, instead of flooding all ports in the VLAN. With IGMP snooping, the router listens to IGMP membership reports, queries and leave messages to identify the switch ports that are members of multicast groups. Multicast traffic will only be forwarded to ports identified as members of the specific multicast group or groups.

Enable IGMP Snooping

Standard Mode

Blocking Mode

Enabling the LAN Side Firewall

Firewall can prevent unexpected traffic on the Internet from your host in the LAN.

Enable LAN side firewall

In this page, you can enable or disable the LAN side firewall.

Configuring the DHCP Server

Enable DHCP Server

Start IP Address:	<input type="text" value="192.168.2.100"/>
End IP Address:	<input type="text" value="192.168.2.199"/>
Primary DNS server:	<input type="text" value="192.168.2.1"/>
Secondary DNS server:	<input type="text" value="192.168.2.1"/>
Leased Time (hour):	<input type="text" value="24"/>

If you enable the DHCP server, the clients will automatically acquire the IP address from the DHCP server. If the DHCP server is disabled, you need to manually set the start IP address, end IP address and the lease time for the clients in the LAN.

Editing the DHCP Option

Click the **Edit DHCP Option** button in the **Local Area Network (LAN) Setup** page to display the **DHCP Option Setup** page.

DHCP Option Setup

This page allows you to configure the DHCP OPTION. These options will be sent to DHCP client. You can define at most 30 options.

State	Code	Value	Pool
-------	------	-------	------

In this page, you can add, edit or delete the DHCP options, and these options will be sent to the DHCP client.

Editing the DHCP Option60

Click the **Edit DHCP Option60** button in the **Local Area Network (LAN) Setup** page to display the **DHCP Option60 Setup** page.

DHCP OPTION 60 SETUP

This page allow you to setup dhcp option 60, the dhcp server will assign one ip address based on you setting to dhcp client.

DHCP OPTION 60 TABLE:

State	deviceClassName	vendorId	minAddress	maxAddress	dnsPrimary	dnsSecondary	subnetMask	gateWay	dhcpLeaseTime
-------	-----------------	----------	------------	------------	------------	--------------	------------	---------	---------------

In this page, you can add, edit or delete the DHCP60 options.

DHCP Advanced Setup

Click the **DHCP Advance Setup** button in the **Local Area Network (LAN) Setup** page to display the following page. In this page, you can enable or disable DHCP for every LAN interface.

DHCP Advance Setup

This page allows you to enable or disable dhcp for every lan interface. You must enable **lan ports**.

State	Interface
<input checked="" type="checkbox"/>	eth1
<input checked="" type="checkbox"/>	eth2
<input checked="" type="checkbox"/>	eth3
<input checked="" type="checkbox"/>	wl0
<input checked="" type="checkbox"/>	wl0.1
<input checked="" type="checkbox"/>	wl0.2
<input checked="" type="checkbox"/>	wl0.3

Configuring the DHCP Static IP Lease List

The lease list of static IP address can reserve the static IP addresses for the hosts with the specific MAC addresses. When a host whose MAC address is in the lease list of static IP address requests the DHCP server for an IP address, the DHCP server assigns the reserved IP address to the host.

MAC Address	IP Address	Remove
-------------	------------	--------

Click the **Add Entries** button in the **Local Area Network (LAN) Setup** page to display the **DHCP Static IP Lease** page.

DHCP Static IP Lease

Enter the Mac address and Static IP address then click Apply/Save .

MAC Address:

IP Address:

In this page, enter the MAC address of the LAN host and the static IP address that is reserved for the host, and then click the **Apply/Save** button to apply the settings.

Configuring the Second IP Address and Subnet Mask for a LAN Interface

In the **Local Area Network (LAN) Setup** page, you may set the second IP address and the subnet mask for a LAN interface.

Configure the second IP Address and Subnet Mask for LAN interface

IP Address:

Subnet Mask:

After enabling **Configure the second IP Address and Subnet Mask for LAN interface**, enter an IP address and a subnet mask for the LAN interface.

After setting, click the **Apply/Save** button to apply the settings.

5.3.4. NAT

5.3.4.1. Virtual Servers

Firewall can prevent unexpected traffic on the Internet from your host on the LAN. The virtual server can create a channel that can pass through the firewall. In that case, the host on the Internet can communicate with a host on your LAN within certain port range.

Choose **Advanced Setup > NAT > Virtual Servers**, and the following page appears.

NAT -- Virtual Servers Setup

Virtual Server allows you to direct incoming traffic from WAN side (identified by Protocol and External port) to the Internal server with private IP address on the LAN side. The Internal port is required only if the external port needs to be converted to a different port number used by the server on the LAN side. A maximum 32 entries can be configured.

Server Name	External Port Start	External Port End	Protocol	Internal Port Start	Internal Port End	Server IP Address or Hostname	WAN Interface	LAN Loopback	Enable/Disable	Remove
-------------	---------------------	-------------------	----------	---------------------	-------------------	-------------------------------	---------------	--------------	----------------	--------

In this page, you are allowed to add or remove a virtual server entry.

To add a virtual server, do as follows:

Step 1 Click the **Add** button to display the following page.

NAT -- Virtual Servers

Select the service name, and enter the server IP address or hostname, and click "Apply/Save" to forward IP packets for this service to the specified server.

NOTE: The "Internal Port End" cannot be modified directly. Normally, it is set to the same value as "External Port End". However, if you modify "Internal Port Start", then "Internal Port End" will be set to the same value as "Internal Port Start".

Remaining number of entries that can be configured:32

Use Interface:

Service Name:

Select a Service:

Custom Service:

Enable LAN Loopback

Server IP Address or Hostname:

Status:

External Port Start	External Port End	Protocol	Internal Port Start	Internal Port End
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		
		TCP		

- **Use interface:** Select an interface that you want to configure.
- **Select a Service:** Select a proper service in the drop-down list.
- **Custom Server:** Enter a new service name to establish a user service type.
- **Server IP Address or Hostname:** Assign an IP address to virtual server.
- **External Port Start:** When selecting a service, the port number will automatically be displayed. You can modify it if necessary.
- **External Port End:** When selecting a service, the port number will automatically be displayed. You can modify it if necessary.
- **Protocol:** You may select TCP/UDP, TCP, or UDP in the drop-down list.
- **Internal Port Start:** When selecting a service, the port number will automatically be displayed. You can modify it if necessary.
- **Internal Port End:** When selecting a service, the port number will automatically be displayed. You can modify it if necessary.

Step 2 After setting, click **Save/Apply** to save and apply the settings.

5.3.4.2. Port Triggering

Some applications need some ports to be opened in the firewall for the remote access. When an application initializes a TCP/UDP to connect to a remote user, port triggering dynamically opens the open ports of the firewall. Choose **Advanced Settings > NAT > Port Triggering**, and the following page appears.

NAT -- Port Triggering Setup

Some applications require that specific ports in the Router's firewall be opened for access by the remote parties. Port Trigger dynamically opens up the 'Open Ports' in the firewall when an application on the LAN initiates a TCP/UDP connection to a remote party using the 'Triggering Ports'. The Router allows the remote party from the WAN side to establish new connections back to the application on the LAN side using the 'Open Ports'. A maximum 32 entries can be configured.

Application Name	Trigger			Open			WAN Interface	Remove
	Protocol	Port Range		Protocol	Port Range			
		Start	End		Start	End		

In this page, you may add or remove an entry of port triggering. Click the **Add** button to display the following page.

NAT -- Port Triggering

Some applications such as games, video conferencing, remote access applications and others require that specific ports in the Router's firewall be opened for access by the applications. You can configure the port settings from this screen by selecting an existing application or creating your own (Custom application) and click "Save/Apply" to add it.
Remaining number of entries that can be configured:32

Use Interface:

Application Name:

Select an application:

Custom application:

Trigger Port Start	Trigger Port End	Trigger Protocol	Open Port Start	Open Port End	Open Protocol
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼
		TCP ▼			TCP ▼

- **Use interface:** Select an interface that you want to configure.
- **Select an application:** Select a proper application in the drop-down list.
- **Custom application:** Manually define an application.
- **Trigger port Start:** The start port number that LAN uses to trigger the open port.
- **Trigger port End:** The end port number that LAN uses to trigger the open port.
- **Trigger Protocol:** Select the application protocol. You may select TCP/UDP, TCP, or UDP.
- **Open Port Start:** The start port number that is opened to WAN.
- **Open Port End:** The end port number that is opened to WAN.
- **Open Protocol:** Select the proper protocol that is opened to WAN. You may select TCP/UDP, TCP, or UDP.

After setting, click **Save/Apply** to apply the settings.

Note:

You can use a single port number, several port numbers separated by commas, port blocks consisting of two port numbers separated by a dash, or any combination of these, for example 80, 90-140, 180.

5.3.4.3. DMZ Host

DMZ allows all the ports of a PC on your LAN to be exposed to the Internet. Set the IP address of the PC to be DMZ host, so that the DMZ host will not be blocked by firewall.

Choose **Advanced Setup > NAT > DMZ host** to display the following page.

NAT -- DMZ Host

The Broadband Router will forward IP packets from the WAN that do not belong to any of the applications configured in the Virtual Servers table to the DMZ host computer.

Enter the computer's IP address and click 'Apply' to activate the DMZ host.

Clear the IP address field and click 'Apply' to deactivate the DMZ host.

DMZ Host IP Address:

Enable LAN Loopback

Apply/Save

In this page, enter the IP address of the DMZ host.

After setting, click the **Apply/Save** button to apply the settings.

To clear the DMZ function of the host, delete the IP address of the host in the field of **DMZ Host IP Address**, and then click the **Apply/Save** button.

5.3.5. Security

By default, the firewall is enabled. The firewall is used to block the file transmission between the Internet and your PC. It serves as a safety guard and permits only the authorized files to be sent to the LAN.

Note:

If the DSL router is configured as bridge mode, **Firewall** is disabled.

Firewall

When the Firewall is enabled on the DSL router, the security functions for the local network and the internet are enabled at the same time.

Choose **Security > Firewall** and the following page appears.

Firewall Table

name	interface	type	defaultaction	bytes	pkts
------	-----------	------	---------------	-------	------

Firewall's Rule Table

enabled	IPVersion	PacketLength	DSCP/TC	Protocol	Action	RejectType	IcmpType	TCP Flags	origIPAddress	origMask/prefixLength	origPort
---------	-----------	--------------	---------	----------	--------	------------	----------	-----------	---------------	-----------------------	----------

Add Firewall Add Rule Modify Firewall Modify Rule Cancel Remove Firewall Remove Rule

Click **Modify Firewall** or **Remove Firewall** to modify or remove the firewall.
 Click **Modify Rule** or **Remove Rule** to modify or remove the rule.
 Click **Add Firewall**, and the following page appears.

Firewall

a Firewall have a number of Rule which define the behavior of match item

name: interface type defaultaction

- **Name:** The name of the firewall.
- **Interface:** You can select a **proper interface** from the drop-down list.
- **Type:** select **In**, the firewall blocks or permits the IP packet transmission from the internet. Select **Out**, the firewall blocks or permits the IP packet transmission from LAN.
- **Defaultaction:** Select **Permit** to allow IP packet transmission at the direction specified in **type**. Select **Drop** to block the IP packet transmission at the direction specified in **type**.

MAC Filtering

In some cases, you may want to manage Layer2 MAC address to block or permit a computer within the home network. When you enable MAC filter rules, the DSL router serves as a firewall that works at layer 2.

Note:

MAC filtering is only effective on ATM PVCs configured in **bridge mode**.
 If the connection type is set to be **bridge** mode, Choose **Security > MAC Filtering** and the following page appears.

MAC Filtering Setup

MAC Filtering is only effective on ATM PVCs configured in Bridge mode. **FORWARDED** means that all MAC layer frames will be **FORWARDED** except those matching with any of the specified rules in the following table. **BLOCKED** means that all MAC layer frames will be **BLOCKED** except those matching with any of the specified rules in the following table.

MAC Filtering Policy For Each Interface(maximum 32 entries): (maximum 32 entries):
WARNING: Changing from one policy to another of an interface will cause all defined rules for that interface to be REMOVED AUTOMATICALLY! You will need to create new rules for the new policy.

Choose Add or Remove to configure MAC filtering rules.

Interface	Protocol	Destination MAC	Source MAC	Frame Direction	8021.p Priority	VlanID	Remove
<input type="button" value="Add"/> <input type="button" value="Remove"/>							

In this page, you can add or remove the MAC filtering rule. You may change the MAC filtering policy from **FORWARDED** to **BLOCKED** by clicking the **Change Policy** button.

Click the **Add** button to display the following page.

Add MAC Filter

Create a filter to identify the MAC layer frames by specifying at least one condition below. If multiple conditions are specified, all of them take effect. Click 'Apply' to save and activate the filter.

Protocol Type:

Destination MAC Address:

Source MAC Address:

Frame Direction:

802.1p Priority:

Tag VLAN ID [0-4094]:

WAN Interfaces (Configured in Bridge mode only)

Apply/Save

- **Protocol Type:** Select the proper protocol type.
- **Destination MAC Address:** Enter the destination MAC address.
- **Source MAC Address:** Enter the source MAC address.
- **Frame Direction:** The direction of transmission frame.
- **WAN Interface (Configured in bridge mode only):** Select the proper WAN interface in the drop-down list.

After setting, click **Apply/Save** to save and apply the filtering rule.

5.3.6. Parental Control

Time Restriction

Choose **Advanced Setup > Parental Control > Time Restriction**, and the following page appears.

Access Time Restriction -- A maximum 16 entries can be configured.

Username	MAC	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Start	Stop	Remove
----------	-----	-----	-----	-----	-----	-----	-----	-----	-------	------	--------

Click the **Add** button to display the following page.

Access Time Restriction

This page adds time of day restriction to a special LAN device connected to the Router. The 'Browser's MAC Address' automatically displays the MAC address of the LAN device where the browser is running. To restrict other LAN device, click the 'Other MAC Address' button and enter the MAC address of the other LAN device. To find out the MAC address of a Windows based PC, go to command window and type 'ipconfig /all'.

User Name

Browser's MAC Address

Other MAC Address

(xx:xx:xx:xx:xx:xx)

Days of the week	Mon	Tue	Wed	Thu	Fri	Sat	Sun
Click to select	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Start Blocking Time (hh:mm)

End Blocking Time (hh:mm)

Apply/Save

This page is used to control the time restriction to a special LAN device that connects to the DSL router. In this page, enter the user name and configure the time settings.

After setting, click the **Apply/Save** button to save and apply the settings.

Url Filter

Click **Advanced Setup > Parental Control > Url Filter**, and the following page appears.

URL Filter -- Please select the list type first then configure the list entries. Maximum 100 entries can be configured.

URL List Type: Exclude Include

Address	Port	Remove
		<input type="checkbox"/>

This page is used to prevent the LAN users from accessing some Websites in the WAN.

In this page, you may select the **Exclude** URL list type or the **Include** URL list type. If you select the **Exclude** URL list type, it means that the URLs in the list are not accessible. If you select the **Include** URL list type, you are allowed to access the URLs in the list.

Click the **Add** button to display the following page.

Parental Control -- URL Filter Add

Enter the URL address and port number then click 'Apply/Save' to add the entry to the URL filter.

URL Address:
Port Number: (Default 80 will be applied if leave blank.)

In this page, enter the URL address and its corresponding port number. For example, enter the URL address ***http://www.google.com*** and the port number **80**, and then click the **Apply/Save** button. See the following figure:

URL Filter -- Please select the list type first then configure the list entries. Maximum 100 entries can be configured.

URL List Type: Exclude Include

Address	Port	Remove
http://www.google.com	80	<input type="checkbox"/>

5.3.7. Quality of Service

Choose **Advance Setup > Quality of Service** and the following page appears.

QoS -- Queue Management Configuration

If Enable QoS checkbox is selected, choose a default DSCP mark to automatically mark incoming traffic without reference to a particular classifier. Click 'Apply/Save' button to save it.

Note: If Enable QoS checkbox is not selected, all QoS will be disabled for all interfaces.

Note: The default DSCP mark is used to mark all egress packets that do not match any classification rules.

Enable QoS

Apply/Save

Select **Enable QoS** to enable QoS and configure the default DSCP mark.

QoS -- Queue Management Configuration

If Enable QoS checkbox is selected, choose a default DSCP mark to automatically mark incoming traffic without reference to a particular classifier. Click 'Apply/Save' button to save it.

Note: If Enable QoS checkbox is not selected, all QoS will be disabled for all interfaces.

Note: The default DSCP mark is used to mark all egress packets that do not match any classification rules.

Enable QoS

Select Default DSCP Mark

Apply/Save

In this page, enable the QoS function and select the default DSCP mark. After setting, click **Apply/Save** to save and apply the settings.

Note:

If the **Enable QoS** checkbox is not selected, all QoS will be disabled for all interfaces. The default DSCP mark is used to mark all egress packets that do not match any classification rules.

Queue Classification

Choose **Advanced Setup > Quality of Service > QoS Classification** and the following page appears.

QoS Classification Setup -- maximum 32 rules can be configured.

To add a rule, click the **Add** button.

To remove rules, check their remove-checkboxes, then click the **Remove** button.

The **Enable** button will scan through every rules in the table. Rules with enable-checkbox checked will be enabled. Rules with enable-checkbox un-checked will be disabled.

The enable-checkbox also shows status of the rule after page reload.

If you disable WMM function in Wireless Page, classification related to wireless will not take effects

The QoS function has been disabled. Classification rules would not take effects.

CLASSIFICATION CRITERIA													CLASSIFICATION RESULTS							
Class Name	Order	Class Intf	Ether Type	SrcMAC/ Mask	DstMAC/ Mask	SrcIP/ PrefixLength	DstIP/ PrefixLength	Proto	SrcPort	DstPort	DSCP Check	TC Check	802.1P Check	Queue Key	DSCP Mark	TC Mark	802.1P Mark	Rate Limit(kbps)	Enable	Remove

Add Enable Remove

In this page, you can enable, add or remove a QoS classification rule. Click the **Add** button to display the following page.

Add Network Traffic Class Rule

This screen creates a traffic class rule to classify the ingress traffic into a priority queue and optionally mark the DSCP or Ethernet priority of the packet. Click 'Apply/Save' to save and activate the rule.

Traffic Class Name:

Rule Order:

Rule Status:

Specify Classification Criteria (A blank criterion indicates it is not used for classification.)

Class Interface:

Ether Type:

Source MAC Address:

Source MAC Mask:

Destination MAC Address:

Destination MAC Mask:

Specify Classification Results (A blank value indicates no operation.)

Specify Class Queue (Required):

- Packets classified into a queue that exit through an interface for which the queue is not specified to exist, will instead egress to the default queue on the interface.

Mark 802.1p priority:

- Class non-vlan packets egress to a non-vlan interface will be tagged with VID 0 and the class rule p-bits.
- Class vlan packets egress to a non-vlan interface will have the packet p-bits re-marked by the class rule p-bits. No additional vlan tag is added.
- Class non-vlan packets egress to a vlan interface will be tagged with the interface VID and the class rule p-bits.
- Class vlan packets egress to a vlan interface will be additionally tagged with the packet VID, and the class rule p-bits.

Set Rate Limit: [Kbits/s]

In this page, enter the traffic name, select the rule order and the rule status, and specify the classification criteria and the classification results. After setting, click **Apply/Save** to save and apply the settings.

5.3.8. Routing

Default Gateway

Choose **Advanced Setup > Routing > Default Gateway**, and the following page appears.

Routing -- Default Gateway

Default gateway interface list can have multiple WAN interfaces served as system default gateways but only one will be used according to the priority with the first being the highest and the last one the lowest priority if the WAN interface is connected. Priority order can be changed by removing all and adding them back in again.

Selected Default Gateway Interfaces		Available Routed WAN Interfaces
ppp0.1	<input type="button" value="->"/> <input type="button" value="<-"/>	

TODO: IPV6 ***** Select a preferred wan interface as the system default IPv6 gateway.

Selected WAN Interface

In this page, you can modify the default gateway settings.

Select a proper WAN interface and add it to the column of **Selected Default Gateway Interface** as the system default gateway.

After setting, click **Apply/Save** to save and apply the settings.

Static Route

Choose **Advanced Setup > Routing > Static Route** and the following page appears.

Routing -- Static Route (A maximum 32 entries can be configured)

IP Version	DstIP/Mask	Gateway	Interface	Metric	Remove
<input type="button" value="Add"/> <input type="button" value="Remove"/>					

In this page, you can add or remove a static routing rule.

Click the **Add** button to display the following page.

Routing -- Static Route Add

Enter the destination network address, subnet mask, gateway AND/OR available WAN interface then click 'Apply/Save' to add the entry to the routing table.

IP Version:	<input type="text" value="IPv4"/>
Destination IP address/prefix length:	<input type="text"/>
Interface:	<input type="text"/>
Gateway IP Address:	<input type="text"/>
(optional: metric number should be greater than or equal to zero)	
Metric:	<input type="text"/>
<input type="button" value="Apply/Save"/>	

- **IP Version:** Select the IP version to be IPv4.
- **Destination IP address/prefix length:** Enter the destination IP address.
- **Interface:** Select the proper interface for the rule.
- **Gateway IP Address:** The next-hop IP address.

- **Metric:** The metric value of routing.

After setting, click **Apply/Save** to save and apply the settings.

Policy Routing

Choose **Advanced Setup > Routing > Policy Routing** and the following page appears.

Policy Routing Setting -- A maximum 7 entries can be configured.

Policy Name	Source IP	LAN Port	WAN	Default GW	Remove
<input type="button" value="Add"/> <input type="button" value="Remove"/>					

In this page, you can add or remove a static policy rule.

Click the **Add** button to display the following page.

Policy Routing Setup

Enter the policy name, policies, and WAN interface then click "Apply/Save" to add the entry to the policy routing table.

Note: If selected "IPoE" as WAN interface, default gateway must be configured.

Policy Name:

Physical LAN Port:

Source IP:

Use Interface:

Default Gateway:

In this page, enter the policy name, source IP and default gateway, and select the physical LAN port and interface.

After setting, click **Apply/Save** to save and apply the settings.

RIP

Choose **Advanced Setup > Routing > RIP** and the following page appears.

Routing -- RIP Configuration

NOTE: RIP CANNOT BE CONFIGURED on the WAN interface which has NAT enabled (such as PPPoE).

To activate RIP for the WAN Interface, select the desired RIP version and operation and place a check in the 'Enabled' checkbox. To stop RIP on the WAN Interface, uncheck the 'Enabled' checkbox. Click the 'Apply/Save' button to star/stop RIP and save the configuration.

Interface	Version	Operation	Enabled
WAN Interface not exist for RIP.			

In this page, to configure an individual interface, select the desired RIP version and operation, and then select the **Enabled** checkbox for the interface.

After setting, click **Apply/Save** to save and apply the settings.

5.3.9. DNS

DNS Server

Choose **Advanced Setup > DNS > DNS Server** and the following page appears.

DNS Server Configuration

Select DNS Server Interface from available WAN interfaces OR enter static DNS server IP addresses for the system. In ATM mode, if only a single PVC with IPoA or static IPoE protocol is configured, Static DNS server IP addresses must be entered.

DNS Server Interfaces can have multiple WAN interfaces served as system dns servers but only one will be used according to the priority with the first being the highest and the last one the lowest priority if the WAN interface is connected. Priority order can be changed by removing all and adding them back in again.

Select DNS Server Interface from available WAN interfaces:

Selected DNS Server Interfaces:

Available WAN Interfaces:

> <

Use the following Static DNS IP address:

Primary DNS server:

Secondary DNS server:

Apply/Save

In this page, you can select a DNS server interface from the available interfaces, manually enter the DNS server addresses, or obtain the DNS address from a WAN interface.

After setting, click **Apply/Save** to save and apply the settings.

Dynamic DNS

Choose **Advanced Setup > DNS > Dynamic DNS** and the following page appears.

Dynamic DNS

The Dynamic DNS service allows you to alias a dynamic IP address to a static hostname in any of the many domains, allowing your Broadband Router to be more easily accessed from various locations on the Internet.

Choose Add or Remove to configure Dynamic DNS.

Hostname	Username	Service	Interface	Remove
----------	----------	---------	-----------	--------

Add Remove

In this page, you are allowed to modify the DDNS settings.

Click the **Add** button to display the following page.

Add Dynamic DNS

This page allows you to add a Dynamic DNS address from DynDNS.org or TZO.

D-DNS provider	<input type="text" value="DynDNS.org"/>
Hostname	<input type="text"/>
Interface	<input type="text" value="ipoa_0_0_38/ipoa0"/>
DynDNS Settings	
Username	<input type="text"/>
Password	<input type="text"/>

- **D-DNS provider:** Select a proper DDNS server in the drop-down list.
- **Hostname:** It is the domain name and it can be modified.
- **Interface:** The interface that the packets pass through on the DSL router.
- **Username:** Enter the username for accessing the DDNS management interface.
- **Password:** Enter the password for accessing the DDNS management interface.

After setting, click **Apply/Save** to save and apply the settings.

5.3.10. DSL

Choose **Advanced Setup > DSL** and the following page appears. In this page, you can view the DSL settings. Usually, you can keep this factory default setting. The modem negotiates the modulation mode with the DSLAM.

DSL Settings

Select the modulation below.

- G.Dmt Enabled
- G.lite Enabled
- T1.413 Enabled
- ADSL2 Enabled
- AnnexL Enabled
- ADSL2+ Enabled
- AnnexM Enabled

Select the phone line pair below.

- Inner pair
- Outer pair

Capability

- Bitswap Enable
- SRA Enable

In this page, you can set the DSL settings. Usually, you do not need to modify the factory default settings.

After setting, click **Apply/Save** to save and apply the settings.

5.3.11. UPnP

Choose **Advanced Setup > UPnP** and the following page appears.

UPnP Configuration

NOTE: UPnP is activated only when there is a live WAN service with NAT enabled.

Enable UPnP

Apply/Save

In this page, you can enable or disable the UPnP function.
After setting, click **Apply/Save** to save and apply the settings.

5.3.12. DNS Proxy

Choose **Advanced Setup > DNS Proxy** and the following page appears.

DNS Proxy Configuration

Enable DNS Proxy

Host name of the Broadband Router:

Domain name of the LAN network:

Apply/Save

In this page, you can enable or disable the DNS proxy function.
After enabling the DNS proxy function, enter the host name of the broadband router and the domain name of the LAN network, and then click **Apply/Save** to save and apply the settings.

5.3.13. Print Server

Choose **Advanced Setup > Printer Server** and the following page appears.

Print Server settings

This page allows you to enable / disable printer support.

Enable on-board print server.

Apply/Save

In this page, you can enable or disable the printer server.
After setting, click **Apply/Save** to save and apply the settings.

5.3.14. Packet Acceleration

Choose **Advanced Setup > Packet Acceleration** and the following page appears. In this page, you can enable packet flow accelerator.

Packet Acceleration

Enable Packet Flow Accelerator

Apply/Save

5.3.15. Storage Service

Storage Device Info

Choose **Advanced Setup > Storage Service > Storage Device Info**, and the following page appears. In this page, you can view the USB device info.

Storage Service

The Storage service allows you to use Storage devices with modem to be more easily accessed

Volumename	PhysicalMedium	FileSystem	Total Space(M)	Used Space(M)
------------	----------------	------------	----------------	---------------

User Accounts

Choose **Advanced Setup > Storage Service > User Accounts**, and the following page appears. In this page, you may add or remove storage user accounts.

Storage UserAccount Configuration

Choose Add, or Remove to configure User Accounts.

UserName Remove

Add Remove

Click the **Add** button to display the following page.

Storage User Account Setup

In the boxes below, enter the user name, password and volume name on which the home directory is to be created.
Username and Password must consists of [A-Z] or [a-z] or [0-9].

Username:
Password:
Confirm Password:

Apply/Save

Enter the user name, password and volume name, and then click **Apply/Save** to finish setting up an account.

To delete an account, select it in the **Storage UserAccount Configuration** page, and then click **Remove**.

5.3.16. Interface Grouping

Choose **Advanced Setup > Interface Grouping** and the following page appears.

Interface Grouping -- A maximum 16 entries can be configured

Interface Grouping supports multiple ports to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the Add button. The Remove button will remove the grouping and add the ungrouped interfaces to the Default group. Only the default group has IP interface.

Group Name	Remove	WAN Interface	LAN Interfaces	Edit
Default		ppp0.1	eth1	
		atm0.2	eth2	
			eth3	
			wl0	
			wl0.1	
			wl0.2	
			wl0.3	

Interface grouping supports multiple ports to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with the appropriate LAN and WAN interfaces using the **Add** button. The **Remove** button will remove the grouping and add the ungrouped interfaces to the default group. Only the default group has IP interface.

Click the **Add** button to display the following page.

Interface grouping Configuration

To create a new interface group:

1. Enter the Group name and the group name must be unique.
2. Select interfaces from the available interface list and add it to the grouped interface list using the arrow buttons to create the required mapping of the ports.
3. Click Save/Apply button to make the changes effective immediately.

Group Name:

Grouped WAN Interfaces	Available WAN Interfaces
<div style="border: 1px solid black; height: 80px;"></div>	pppoe_0_0_35/ppp0.1

->
<-

Grouped LAN Interfaces	Available LAN Interfaces
<div style="border: 1px solid black; height: 80px;"></div>	eth0 eth1 eth2 eth3 wlan0 w10_Guest1 w10_Guest2 w10_Guest3

->
<-

In this page, please follow the on-screen configuration steps to configure the parameters of the interface grouping.

After setting, click **Apply/Save** to save and apply the settings.

5.3.17. IP Tunnel

IPv6inIPv4

Choose **Advanced Setup > IP Tunnel > IPv6inIPv4**, and the following page appears.

IP Tunneling -- 6in4 Tunnel Configuration

Name	WAN	LAN	Dynamic	IPv4 Mask Length	6rd Prefix	Border Relay Address	Remove
<input type="button" value="Add"/> <input type="button" value="Remove"/>							

Click the **Add** button, and the following page appears.

IP Tunneling -- 6in4 Tunnel Configuration

Currently, only 6rd configuration is supported.

Tunnel Name:

Mechanism:

Associated WAN Interface:

Associated LAN Interface:

Manual Automatic

IPv4 Mask Length:

6rd Prefix with Prefix Length:

Border Relay IPv4 Address:

Click **Apply/Save** to save and enable the settings.

IPv4inIPv6

Choose **Advanced Setup > IP Tunnel > IPv4inIPv6**, and the following page appears.

IP Tunneling -- 4in6 Tunnel Configuration

Name	WAN	LAN	Dynamic	Remote IPv6 Address	Remove
------	-----	-----	---------	---------------------	--------

Click the **Add** button, and the following page appears.

IP Tunneling -- 4in6 Tunnel Configuration

Currently, only DS-Lite configuration is supported.

Tunnel Name:

Mechanism:

Associated WAN Interface:

Associated LAN Interface:

Manual Automatic

Remote IPv6 Address:

Click **Apply/Save** to save and enable the settings.

5.3.18. Certificate

Local

Choose **Advanced Setup > Certificate > local** and the following page appears.

Local Certificates

Add, View or Remove certificates from this page. Local certificates are used by peers to verify your identity.
Maximum 4 certificates can be stored.
Notice: Import and Remove Certificate need reboot the gateway

Name	In Use	Subject	Type	Action
------	--------	---------	------	--------

In this page, you can acquire the local certificate by creating a certificate request or importing a certificate. You may also create or remove a certificate.

- **Creating a New Certificate Request**

Click the **Create Certificate Request** button to display the following page.

Create new certificate request
 To generate a certificate signing request you need to include Common Name, Organization Name, State/Province Name, and the 2-letter Country Code for the certificate.

Certificate Name:	<input type="text"/>
Common Name:	<input type="text"/>
Organization Name:	<input type="text"/>
State/Province Name:	<input type="text"/>
Country/Region Name:	US (United States) <input type="button" value="v"/>

In this page, please set the following parameters.

- **Certificate name:** Set the certificate name.
- **Common Name:** The common name is the "fully qualified domain name," (or FQDN) used for DNS lookups of your server (for example, www.mydomain.com). Browsers use this information to identify your Web site. Some browsers will refuse to establish a secure connection with your site if the server name does not match the common name in the certificate. Please do not include the protocol symbol "http://" or any port numbers or pathnames in the common name. Do not use wildcard characters such as * or ?, and do not use an IP address.
- **Organization Name:** The name of the organization to which the entity belongs (such as the name of a company).
- **State/Province Name:** This is the name of the state or province where your organization's head office is located. Please enter the full name of the state or province.
- **Country/Region Name:** This is the two-letter ISO abbreviation for your country (for example, GB for the United Kingdom).

After setting, click the **Apply** button to apply the settings.

Certificate signing request
 Certificate signing request successfully created. Note a request is not yet functional - have it signed by a Certificate Authority and load the signed certificate to this device.

Name	test
Type	request
Subject	CN=test/O=test/ST=guangdong/C=CN
Signing Request	<pre>-----BEGIN CERTIFICATE REQUEST----- MIIBfjCB6AIBADA/MQ0wCwYDVQQDEwR0ZXNOMQ0wCwYDVQQKEwR0ZXNOMR.IwEAYD VQQIEwLndWFuZ2RvbmxczAJBgNVBAYTAkNOMIGfMAOGCSqGSIb3DQEBAQUAA4GN ADCBiQKBgQCIMyqBx3gtIp16ufx+Rb00WH2Q67+fy36IUhSEg1kNkdEMnaUN0bd isL66+XP+Gu+gEs+pgQ4aAoXjvY4k0ZskhKJTD6r41zvIhnTf4nNKz0H+rnQkUT 1RGjA6DTef aXSRemVshjF7CZt ovHHICu5/XhDKfPGvrtP7tKnUIdNwIDAQBoAAv DQYIKoZIHvcNAQEEBQADgYEAL9WxsV12XLDPMxAlE6QiiSVRQg2Z/GiirG7BZ+6 bK2Y1euq01GFQvkzrNEqA04DeAb+qkI2JBP6KqotucVYRHfvHF//naCM51pxH8wN YLw9+2L+DYCaSN6P4b3Gfa6qvfo6xqiRnqA31XvFW1u1ldhw9ValUbs13jDZj7x0f QFk= -----END CERTIFICATE REQUEST-----</pre>

The certificate request needs to be submitted to a certificate authority, which will sign the request. Then the signed certificate needs to be loaded to the DSL router. Click **Load Signed Certificate** in this page, and the following page appears.

Load certificate

Paste signed certificate.

Certificate Name:

Certificate:

```
-----BEGIN CERTIFICATE-----  
<insert certificate here>  
-----END CERTIFICATE-----
```

In this page, paste the signed certificate, and then click the **Apply** button. A new certificate is created.

● Importing an Existing Local Certificate

To import an existing certificate, click the **Import Certificate** button to display the following page.

Import certificate

Enter certificate name, paste certificate content and private key.

Certificate Name:

Certificate:

```
-----BEGIN CERTIFICATE-----  
<insert certificate here>  
-----END CERTIFICATE-----
```

Private Key:

```
-----BEGIN RSA PRIVATE KEY-----  
<insert private key here>  
-----END RSA PRIVATE KEY-----
```

In this page, paste the certificate and the private key. Finally, click the **Apply** button to import the certificate.

Trusted CA

Choose **Advanced Setup > Certificate > Trusted CA** and the following page appears.

Trusted CA (Certificate Authority) Certificates

Add, View or Remove certificates from this page. CA certificates are used by you to verify peers' certificates.
Maximum 4 certificates can be stored.

Notice: Import and Remove Certificate need reboot the gateway

Name	Subject	Type	Action
<input type="button" value="Import Certificate"/>			

In this page, you may import or remove a CA certificate.
Click the **Import Certificate** button to display the following page.

Import CA certificate

Enter certificate name and paste certificate content.
Notice: If certificate use for tr069, the Certificate Name must be "accsert"

Certificate Name:

Certificate:

```
-----BEGIN CERTIFICATE-----  
<insert certificate here>  
-----END CERTIFICATE-----
```

In this page, enter the certificate name and paste the certificate content.
Finally, click the **Apply** button to import the certificate.

5.3.19. Power Management

Choose **Advanced Setup > Power Management** and the following page appears. This page allows control of Hardware modules to evaluate power consumption. Use the control buttons to select the desired option.

Power Management

This page allows control of Hardware modules to evaluate power consumption. Use the control buttons to select the desired option, click Apply and check the status response.

Wait instruction when Idle
 Enable **Status: Enabled**

After proper configurations, click **Apply** to take the configurations effect.

5.3.20. Multicast

Choose **Advanced Setup > Multicast** and the following page appears.

IGMP Configuration

Enter IGMP protocol configuration fields if you want modify default values shown below.
NOTE: Query Interval is advised to no larger than 125s.

Default Version:	<input type="text" value="3"/>
Query Interval (s):	<input type="text" value="125"/>
Query Response Interval (1/10s):	<input type="text" value="100"/>
Last Member Query Interval (1/10s):	<input type="text" value="10"/>
Robustness Value:	<input type="text" value="2"/>
Maximum Multicast Data Sources (for IGMPv3):	<input type="text" value="10"/>
Fast Leave Enable:	<input checked="" type="checkbox"/>
Membership Join Immediate (IPTV):	<input type="checkbox"/>

MLD Configuration

Enter MLD protocol (IPv6 Multicast) configuration fields if you want modify default values shown below.

Default Version:	<input type="text" value="2"/>
Query Interval (s):	<input type="text" value="125"/>
Query Response Interval (1/10s):	<input type="text" value="100"/>
Last Member Query Interval (1/10s):	<input type="text" value="10"/>
Robustness Value:	<input type="text" value="2"/>
Maximum Multicast Data Sources (for mldv2):	<input type="text" value="10"/>
Fast Leave Enable:	<input checked="" type="checkbox"/>

In this page, you can configure the multicast parameters.
After setting, click **Apply/Save** to save and apply the settings.

5.4. Wireless

Choose **Wireless** and the submenus of **Wireless** are shown as below:

5.4.1. Basic

Choose **Wireless > Basic** to display the following page.

Wireless -- Basic

This page allows you to configure basic features of the wireless LAN interface. You can enable or disable the wireless LAN interface, hide the network from active scans, set the wireless network name (also known as SSID) and restrict the channel set based on country requirements.

Click 'Apply/Save' to configure the basic wireless options.

- Enable Wireless
- Enable Wireless Hotspot2.0 [WPA2 is required!]
- Hide Access Point
- Clients Isolation
- Disable WMM Advertise
- Enable Wireless Multicast Forwarding (WMF)

SSID:
BSSID:
Country:
Max Clients:

Wireless - Guest/Virtual Access Points:

Enabled	SSID	Hidden	Isolate Clients	Enable WMM Advertise	Enable WMF	Enable HSPOT	Max Clients	BSSID
<input type="checkbox"/>	<input type="text" value="WLAN_Guest1"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="16"/>	N/A
<input type="checkbox"/>	<input type="text" value="WLAN_Guest2"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="16"/>	N/A
<input type="checkbox"/>	<input type="text" value="WLAN_Guest3"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="16"/>	N/A

This page allows you to configure the basic features of the wireless LAN interface.

- **Enable Wireless:** Enable or disable the wireless function.
- **Hide Access Point:** if you want to hide any access point for your router, select this option, and then a station cannot obtain the SSID through the passive scanning.
- **Clients Isolation:** When many clients connect to the same access point, they can access each other. If you want to disable the access between the clients that connect to the same access point, you can select this option.
- **Disable WMM Advertise:** After enabling this option, the transmission performance multimedia of the voice and video data can be improved.
- **Enable Wireless Multicast Forwarding (WMF):** After enabling this option, the transmission quality of video service such as IPTV can be improved.
- **SSID:** For the security reason, you should change the default SSID to a unique name.
- **BSSID:** Display the MAC address of the wireless interface.
- **Country:** The name of the country with which your gateway is configured. This parameter further specifies your wireless connection. For example, the channel will adjust according to nations to adapt to each nation's frequency provision.

- **Max Clients:** Specify the maximum wireless client stations to be enabled to link with AP. Once the clients exceed the max value, all other clients are refused. The value of maximum clients is 16.
- **Wireless - Guest/Virtual Access Points:** If you want to make Guest/Virtual network function be available, you have to check those boxes in the table below. In the current software version, three virtual access points can be configured.

After setting, click **Apply/Save** to save the basic wireless settings and make the settings take effect.

5.4.2. Security

Choose **Wireless > Security** to display the following page.

Wireless -- Security

This page allows you to configure security features of the wireless LAN interface.
You may setup configuration manually
OR
through WiFi Protected Setup(WPS)
Note: When both STA PIN and Authorized MAC are empty, PBC is used. If Hide Access Point enabled or Mac filter list is empty with "allow" chosen, WPS2 will be disabled

WPS Setup

Enable WPS

Manual Setup AP

You can set the network authentication method, selecting data encryption, specify whether a network key is required to authenticate to this wireless network and specify the encryption strength. Click 'Apply/Save' when done.

Select SSID:

Network Authentication:

WEP Encryption:

This page allows you to configure the security features of the wireless LAN interface. In this page, you can configure the network security settings by the Wi-Fi Protected Setup (WPS) method or setting the network authentication mode.

● WPS Setup

WPS Setup

Enable WPS

Add Client (This feature is available only when WPA-PSK(WPS1), WPA2 PSK or OPEN mode is configured)

Push-Button

Enter STA PIN Use AP PIN

Set WPS AP Mode

Setup AP (Configure all security settings with an external registrar)

Device PIN [Help](#)

There are 2 primary methods used in the Wi-Fi Protected Setup:

PIN entry, a mandatory method of setup for all WPS certified devices.

Push button configuration (PBC), an actual push button on the hardware or through a simulated push button in the software. (This is an optional method on wireless client).

If you are using the PIN method, you will need a Registrar (access point/wireless router) to initiate the registration between a new device and an active access point/wireless router. (**Note:** *The PBC method may also need a Registrar when used in a special case where the PIN is all zeros*)

In order to use the push-button for WPS authentication, you must ensure that the network card support the function. if it supports, you need not to do any configuration. You can press the WPS button directly to enable the WPS function.

● Manual Setup AP

- Open Mode

Manual Setup AP

You can set the network authentication method, selecting data encryption, specify whether a network key is required to authenticate to this wireless network and specify the encryption strength. Click 'Apply/Save' when done.

Select SSID:	<input type="text" value="GOLDWEB_92477C"/>
Network Authentication:	<input type="text" value="Open"/>
WEP Encryption:	<input type="text" value="Enabled"/>
Encryption Strength:	<input type="text" value="64-bit"/>
Current Network Key:	<input type="text" value="1"/>
Network Key 1:	<input type="text" value="0987654321"/>
Network Key 2:	<input type="text" value="0987654321"/>
Network Key 3:	<input type="text" value="0987654321"/>
Network Key 4:	<input type="text" value="0987654321"/>

Enter 13 ASCII characters or 26 hexadecimal digits for 128-bit encryption keys
Enter 5 ASCII characters or 10 hexadecimal digits for 64-bit encryption keys

- **Select SSID:** Select a SSID for configuring the security settings.
- **Network Authentication:** Select the Open mode.
- **WEP Encryption:** Enable or disable WEP encryption. After enabling this function, you can set the encryption strength, current network key, and network keys.
- **Encryption Strength:** You can set 64-bit or 128-bit key.
- **Current Network Key:** The current key that you use.
- **Network Key1/2/3/4:** Set the network key. If it is 128-bit key, you need to enter 13 ASCII characters or 26 hexadecimal digits. For the 64-bit key, you need to enter 5 ASCII characters or 10 hexadecimal digits.

- Shared Mode

Network Authentication:	Shared
WEP Encryption:	Enabled
Encryption Strength:	64-bit
Current Network Key:	
Network Key 1:	0987654321
Network Key 2:	0987654321
Network Key 3:	0987654321
Network Key 4:	0987654321

Enter 13 ASCII characters or 26 hexadecimal digits for 128-bit encryption keys
Enter 5 ASCII characters or 10 hexadecimal digits for 64-bit encryption keys

Apply/Save

For the parameter description of shared mode, refer to the **Open Mode**.

- 802.1x

Network Authentication:	802.1X
RADIUS Server IP Address:	0.0.0.0
RADIUS Port:	1812
RADIUS Key:	
WEP Encryption:	Enabled
Encryption Strength:	64-bit
Current Network Key:	2
Network Key 1:	0987654321
Network Key 2:	0987654321
Network Key 3:	0987654321
Network Key 4:	0987654321

Enter 13 ASCII characters or 26 hexadecimal digits for 128-bit encryption keys
Enter 5 ASCII characters or 10 hexadecimal digits for 64-bit encryption keys

Apply/Save

- **Select SSID:** Select a SSID for configuring the security settings.
- **Network Authentication:** Select the 802.1X in the drop-down list.
- **RADIUS Server IP Address:** Enter the IP address of the RADIUS server. RADIUS server is used to authenticate the hosts on the wireless network.
- **RADIUS Port:** The port number that the RADIUS server uses. The default port number is 1812. You may change it according to the server setting.
- **RADIUS Key:** Set the RADIUS key for accessing the RADIUS server.
- **WEP Encryption:** You can only select **Enabled**.
- **Encryption Strength:** You can set 64-bit or 128-bit key.
- **Current Network Key:** The current key that you use.
- **Network Key1/2/3/4:** Set the network key. If it is 128-bit key, you need to enter 13 ASCII characters or 26 hexadecimal digits. For the 64-bit key, you need to enter 5 ASCII characters or 10 hexadecimal digits.

- WPA Mode

Network Authentication:	WPA
WPA Group Rekey Interval:	0
RADIUS Server IP Address:	0.0.0.0
RADIUS Port:	1812
RADIUS Key:	
WPA/WAPI Encryption:	TKIP+AES
WEP Encryption:	Disabled

Apply/Save

- **Select SSID:** Select a SSID for configuring the security settings.
- **Network Authentication:** Select the WPA-PSK mode.
- **WPA Group Rekey Interval:** Setting the interval for renewing key.
- **RADIUS Server IP Address:** Enter the IP address of the RADIUS server. RADIUS server is used to authenticate the hosts on the wireless network.
- **RADIUS Port:** The port number that the RADIUS server uses. The default port number is 1812. You may change it according to the server setting.
- **RADIUS Key:** Set the RADIUS key for accessing the RADIUS server.
- **WPA/WAPI Encryption:** You may select AES, or TKIP+AES.

- WPA-PSK Mode

Network Authentication:	WPA-PSK
WPA/WAPI passphrase: Click here to display
WPA Group Rekey Interval:	0
WPA/WAPI Encryption:	TKIP+AES
WEP Encryption:	Disabled

Apply/Save

- **Select SSID:** Select a SSID for configuring the security settings.
- **Network Authentication:** Select the WPA-PSK mode.
- **WPA/WAPI passphrase:** The key for WPA encryption. Click the **Click here to display** button to display the current key. The default key is 87654321.
- **WPA Group Rekey Interval:** Setting the interval for renewing key.
- **WPA/WAPI Encryption:** You may select AES, or TKIP+AES.

- WPA2 Mode

Network Authentication:	WPA2
WPA2 Preauthentication:	Disabled
Network Re-auth Interval:	36000
WPA Group Rekey Interval:	0
RADIUS Server IP Address:	0.0.0.0
RADIUS Port:	1812
RADIUS Key:	
WPA/WAPI Encryption:	AES
WEP Encryption:	Disabled

- **Select SSID:** Select a SSID for configuring the security settings.
- **Network Authentication:** Select the WPA2 mode.
- **WPA2 Preauthentication:** Enable or disable pre-authentication.
- **Network Re-auth Interval:** Set the network re-auth interval.
- **WPA Group Rekey Interval:** Setting the interval for renewing key.
- **RADIUS Server IP Address:** Enter the IP address of the RADIUS server. RADIUS server is used to authenticate the hosts on the wireless network.
- **RADIUS Port:** The port number that the RADIUS server uses. The default port number is 1812. You may change it according to the server setting.
- **RADIUS Key:** Set the RADIUS key for accessing the RADIUS server.
- **WPA/WAPI Encryption:** You may select AES, or TKIP+AES.

For the parameters' description of **WPA2-PSK, Mixed WPA2/WPA, Mixed WPA2/WPA-PSK** mode, please refer to the **WPA-PSK mode**.

5.4.3. MAC Filter

Choose **Wireless > MAC Filter** to display the following page.

Wireless -- MAC Filter

Select SSID: GOLDWEB_92477C

MAC Restrict Mode: Disabled Allow Deny

MAC Address	Remove
-------------	--------

This page is used to allow or reject the wireless clients to access the wireless network of the wireless router.

In this page, you can add or remove the MAC filters.

The MAC restrict modes include **Disabled**, **Allow**, and **Deny**.

- **Disabled**: Disable the wireless MAC address filtering function.
- **Allow**: Allow the wireless clients with the MAC addresses in the **MAC Address** list to access the wireless network of the wireless router.
- **Deny**: Reject the wireless clients with the MAC addresses in the **MAC Address** list to access the wireless network of the wireless router.

Click the **Add** button to display the following page.

Wireless -- MAC Filter

Enter the MAC address and click 'Apply/Save' to add the MAC address to the wireless MAC address filters.

MAC Address:

In this page, enter the MAC address of the wireless client, and then click the **Apply/Save** button to add the MAC address to the MAC address list.

5.4.4. Wireless Bridge

Choose **Wireless > Wireless Bridge** to display the following page.

Wireless -- Bridge

This page allows you to configure wireless bridge features of the wireless LAN interface. You can select Wireless Bridge (also known as Wireless Distribution System) to disable access point functionality. Selecting Access Point enables access point functionality. Wireless bridge functionality will still be available and wireless stations will be able to associate to the AP. Select Disabled in Bridge Restrict which disables wireless bridge restriction. Any wireless bridge will be granted access. Selecting Enabled or Enabled(Scan) enables wireless bridge restriction. Only those bridges selected in Remote Bridges will be granted access. Click "Refresh" to update the remote bridges. Wait for few seconds to update. Click "Apply/Save" to configure the wireless bridge options.

AP Mode:

Bridge Restrict:

Remote Bridges MAC Address:

This page allows you to configure the wireless bridge features of the wireless LAN interface.

- **AP mode**: you may select **Access Point** or **Wireless Bridge**.
- **Bridge Restrict**: Enable or disable the bridge restrict function.
- **Remote Bridges MAC Address**: Enter the remote bridge MAC address.

After setting, click the **Apply/Save** button to save and apply the settings.

5.4.5. Advanced

Choose **Wireless > Advanced** to display the following page. This page allows you to configure the advanced features of the wireless LAN interface. Usually, you do not need to change the settings in this page.

Wireless -- Advanced
This page allows you to configure advanced features of the wireless LAN interface. You can select a particular channel on which to operate, force the transmission rate to a particular speed, set the fragmentation threshold, set the RTS threshold, set the wakeup interval for clients in power-save mode, set the beacon interval for the access point, set XPress mode and set whether short or long preambles are used.
Click 'Apply/Save' to configure the advanced wireless options.

Band:	2.4GHz	
Channel:	Auto	Current: 1 (interference: acceptable)
Auto Channel Timer(min)	0	
802.11n/EWC:	Auto	
Bandwidth:	20MHz in Both Bands	Current: 20MHz
Control Sideband:	Lower	Current: N/A
802.11n Rate:	Auto	
802.11n Protection:	Auto	
Support 802.11n Client Only:	Off	
RIFS Advertisement:	Off	
OBSS Co-Existence:	Disable	
RX Chain Power Save:	Disable	Power Save status: Full Power
RX Chain Power Save Quiet Time:	10	
RX Chain Power Save PPS:	10	
54g Rate:	1 Mbps	
Multicast Rate:	Auto	
Basic Rate:	Default	
Fragmentation Threshold:	2346	
RTS Threshold:	2347	
DTIM Interval:	1	
Beacon Interval:	100	
Global Max Clients:	16	
XPress Technology:	Enable	
Transmit Power:	100%	
WMM(Wi-Fi Multimedia):	Enabled	
WMM No Acknowledgement:	Disabled	
WMM APSD:	Enabled	

Apply/Save

- **Band:** The radio frequency remains at 2.4GHz.
- **Channel:** Fill in the appropriate channel to correspond with your network settings. All devices in your wireless network must use the same channel in order to work correctly. This router supports auto channeling functionality.
- **Auto Channel Timer (min):** Specifies the timer of auto channelling.
- **802.11n/EWC:** Select **disable** 802.11n or **Auto**.
- **Bandwidth:** Select the bandwidth for the network.
- **802.11n Rate:** Select the transmission rate for the network. The rate of data transmission should be set depending on the speed of your wireless network. You can select from a range of transmission speeds, or you can select **Auto** to have the Router automatically use the fastest possible data rate and enable the Auto-Fallback feature. Auto-Fallback will negotiate the best possible connection speed between the Router and a wireless client. The default value is **Auto**.

- **802.11n Protection:** The 802.11n standards provide a protection method so 802.11b/g and 802.11n devices can co-exist in the same network without “speaking” at the same time.
- **Support 802.11n Client Only:** Only stations that are configured in 802.11n mode can associate.
- **Multicast Rate:** Select the multicast transmission rate for the network. The rate of data transmission should be set depending on the speed of your wireless network. You can select from a range of transmission speeds, or you can select **Auto** to have the Router automatically use the fastest possible data rate and enable the Auto-Fallback feature. Auto-Fallback will negotiate the best possible connection speed between the Router and a wireless client. The default value is **Auto**.
- **Basic Rate:** Select the basic transmission rate ability for the AP.
- **Fragmentation Threshold:** Packets that are larger than this threshold are fragmented into multiple packets. Try to increase the fragmentation threshold if you encounter high packet error rates. Do not set the threshold too low, since this can result in reduced networking performance.
- **RTS Threshold:** This value should remain at its default setting of 2347. Should you encounter inconsistent data flow, only minor reductions are recommended. Should you encounter inconsistent data flow, only minor reduction of the default value, 2347, is recommended. If a network packet is smaller than the preset RTS threshold size, the RTS/CTS mechanism will not be enabled. The Router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. The RTS Threshold value should remain at its default value of 2347.
- **DTIM Interval:** (Delivery Traffic Indication Message) Enter a value between 1 and 255 for the Delivery Traffic Indication Message (DTIM.) A DTIM is a countdown informing clients of the next window for listening to broadcast and multicast messages.
- **Beacon Interval:** A beacon is a packet of information that is sent from a connected device to all other devices where it announces its availability and readiness. A beacon interval is a period of time (sent with the beacon) before sending the beacon again. The beacon interval may be adjusted in milliseconds (ms). Default (100) is recommended.

- **XPress Technology:** Select Enable or Disable. This is a special accelerating technology for IEEE802.11g. The default is Disabled.
- **Transmit Power:** Adjust the transmission range here. This tool can be helpful for security purposes if you wish to limit the transmission range.

Click **Apply/Save** to configure the advanced wireless options and make the changes take effect.

Note:

The advanced wireless setting is only for the advanced user. For the common user, do not change any settings in this page.

5.4.6. Station Info

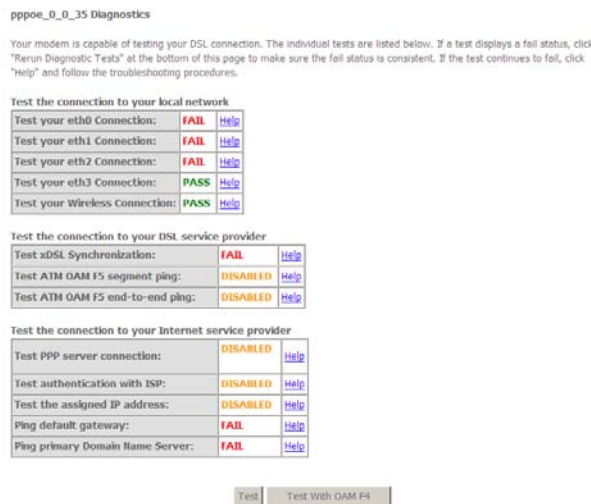

Choose **Wireless > Station Info** to display the following page.

This page shows the authenticated wireless stations and their status.

5.5. Diagnostics

Click **Diagnostics > Diagnostics**, and the following page appears.

Your modem is capable of testing your DSL connection. The individual tests are listed below. If the test continues to fail, click **Help** and follow the troubleshooting procedures.

5.6. Management

5.6.1. Settings

Backup

Choose **Management > Settings > Backup** to display the following page.

In this page, click the **Backup Settings** button to save your router's settings to your local PC.

Update

Choose **Management > Settings > Update**, and the following page appears.

In this page, click the **Browse...** button to select the correct new settings file, and then click the **Update Settings** button to update the router's settings.

Restore Default

Choose **Management > Settings > Restore Default** to display the following page.

In this page, click the **Restore Default Settings** button, and then the system returns to the default settings.

5.6.2. TR-069 Client

Choose **Management > TR-069Client** to display the following page.

TR-069 client - Configuration

WAN Management Protocol (TR-069) allows a Auto-Configuration Server (ACS) to perform auto-configuration, provision, collection, and diagnostics to this device.

Select the desired values and click 'Apply/Save' to configure the TR-069 client options.

Enable WAN Management Protocol (TR-069).
Inform Disable Enable

Inform Interval:
ACS URL:
ACS User Name:
ACS Password:
WAN Interface used by TR-069 client:

Display SOAP messages on serial console Disable Enable

Connection Request Authentication

Connection Request User Name:
Connection Request Password:
Connection Request Port:
Connection Request URL:

WAN Management Protocol (TR-069) allows an Auto-Configuration Server (ACS) to perform auto-configuration, provision, collection, and diagnostics to this device.

In this page, you may configure the parameters such as the ACS URL, ACS password, and connection request user name.

After setting, click the **Apply/Save** button to save and apply the settings.

5.6.3. Access Control

Passwords

Choose **Management > Access Control > Passwords**, and the following page appears.

Access Control -- Passwords

Access to your DSL router is controlled through three user accounts:admin,support and user .

The user name "admin" has unrestricted access to change and view configuration of your DSL Router.

The user name "support" is used to allow an ISP technician to access your DSL Router for maintenance and to run diagnostics.

The user name "user" can access the DSL Router, view configuration settings and statistics, as well as, update the router's software.

Use the fields below to enter up to 16 characters and click 'Apply/Save' to change or create passwords.
Note: Password cannot contain a space.

Username:
New Username:
Old Password:
New Password:
Confirm Password:

In the page, you can modify the username and password of different users. After setting, click the **Apply/Save** button to save and apply the settings.

Services Control

Choose **Management > Access Control > Services Control** and the following page appears.

Access Control -- Services
Services access control list (SCL) enable or disable the running services.

Services	LAN	WAN	Port
HTTP	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="80"/>
TELNET	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="23"/>
FTP	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="21"/>
TFTP	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="69"/>
ICMP	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="0"/>

SAMBA	<input checked="" type="checkbox"/> enable	<input type="checkbox"/> enable	<input type="text" value="445"/>

Apply/Save

In this page, you can enable or disable the different types of services. It is recommended to keep it as default.

After setting, click the **Apply/Save** button to save and apply the settings.

5.6.4. Update Software

Choose **Management > Update Software**, and the following page appears.

Tools -- Update Software

Step 1: Obtain an updated software image file from your ISP.

Step 2: Enter the path to the image file location in the box below or click the 'Browse' button to locate the image file.

Step 3: Click the 'Update Software' button once to upload the new image file.

NOTE: The update process takes about 2 minutes to complete, and your Broadband Router will reboot.

Software File Name:

If you want to upload the software, click the **Browse...** button to choose the new software, and then click the **Update Software** button.

Note:

When software update is in progress, do not shut down the router. After software update completes, the router automatically reboots.

Please make sure that the new software for updating is correct, and do not use other software to update the router.

5.6.5. Reboot

Choose **Management > Reboot** and the following page appears.

Click the button below to reboot the router.

Reboot

In this page, click the **Reboot** button, and then the router reboots.

Appendix I: How to Install and Access the USB Storage

1. Plug USB storage into USB on AR-7288WnA.
2. Log in web management. (Example: HTTP://192.168.2.1)
3. Choose **Advanced Setup > Storage Service Storage Device Info**, and the following page appears. In this page, you can view the USB device info.

Storage Service
The Storage service allows you to use Storage devices with modem to be more easily accessed

Volumename	PhysicalMedium	FileSystem	Total Space	Used Space
usb0_1	PhysicalMedium.0	vfat	30927MB	2MB

4. Choose **Advanced Setup > Storage Service > User Accounts**, and the following page appears. In this page, you may add or remove storage user accounts.

Storage UserAccount Configuration

Choose Add, or Remove to configure User Accounts.

UserName	Remove
----------	--------

<input type="button" value="Add"/>	<input type="button" value="Remove"/>
------------------------------------	---------------------------------------

Click the **Add** button to display the following page.

Storage User Account Setup

In the boxes below, enter the user name, password and volume name on which the home directory is to be created.
Username and Password must consists of [A-Z] or [a-z] or [0-9].

Username:

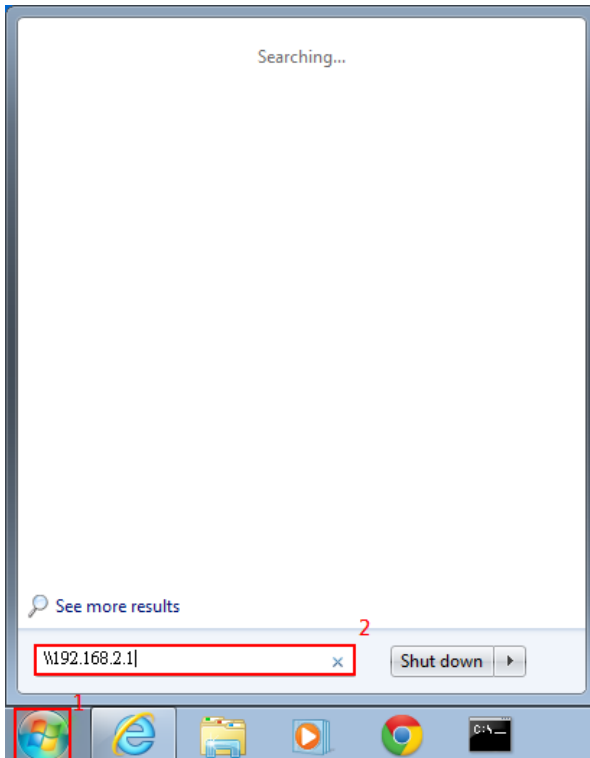

Password:

Confirm Password:

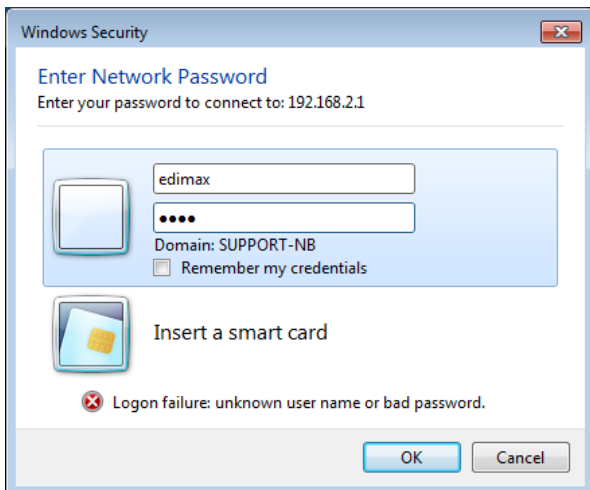

Enter the user name, password and volume name, and then click **Apply/Save** to finish setting up an account.
To delete an account, select it in the **Storage UserAccount Configuration** page, and then click **Remove**.

PC

5. Click **Start**, input [\\192.168.2.1](#) (192.168.2.1 is IP address of AR-7288WnA), and then press **Enter**.

6. Enter username and password which you have added at step 4, and then click **OK**.

7. It will display the USB device. Double click left mouse on the fold, and then you are able to access the data in the USB storage.

MAC OS X

5. Go to **Finder > Go > Connect to Server** and enter **smb://192.168.2.1** (the default IP address of your AR-7288WnA) and click **“Connect”**.

6. Enter the username and password which you added during step 4 and then click **Connect**.

7. The USB drive will be available on your desktop.

Ensure the drive is correctly formatted (Mac OS Extended or exFAT) for use with Mac OS X.

Appendix II

The following are the general settings usually provided by the Internet Service Providers (ISP).

Upon running the “setup wizard” on CD-ROM (See *Quick Installation Guide page 8*) OR “Quick Start” (See *Quick Installation Guide page 10*), all the below Settings (Pointers No. 1 & No. 2) are Pre-Set in AR-7288WnA; except Pointer No. 3, Username and Password (As provided by your ISP). Need to be Input by User accordingly.

General Setting For Australia

- 1) VPI/VCI set to 8/35
- 2) Protocol set to PPP over Ethernet (PPPoE) (RFC 2516) with LLC encapsulation
- 3) Username and password set according to the user ID that the customer has on the service they are trying to connect to (either ISP or corporate). The user name must be set to the user ID followed by an @ symbol followed by the domain name e.g. example1@isp1.com.au or example2@isp2.net.au

General Setting For New Zealand

- 1) VPI/VCI set to 0/100
- 2) Protocol set to PPP over ATM (PPPoA) (RFC 2364) with VC-multiplexed encapsulation
- 3) Username and password set according to the user ID that the customer has on the service they are trying to connect to (either ISP or corporate). The user name must be set to the user ID followed by an @ symbol followed by the domain name e.g. example@isp.co.nz
- 4) Operating Mode set to G.992.1, G.DMT or ANSI T1.413 iss 2 but not G.Lite or G.992.2

Note that:

1. **Reset the device to factory defaults** (see *Quick Installation Guide page 4.*) if you have difficulty to setup your User Name and Password or if you would like to setup new user name or password.
2. Please contact your ISP (Internet Service Provider) if you are not sure about your ADSL 2/2+ modem setup information.

PTC General Warning

The grant of a Telepermit for any item of terminal equipment indicates only that Telecom has accepted that the item complies with minimum conditions for connection to its network. It indicates no endorsement of the product by Telecom, nor does it provide any sort of warranty. Above all, it provides no assurance that any item will work correctly in all respects with another item of Telepermitted equipment of a different make or model, nor does it imply that any product is compatible with all of Telecom's network services.
